Sommerfeldsche Polynommethode Wojciech Rubinowicz,1972 Geometry of Algebraic Curves Enrico Arbarello,Maurizio Cornalba,Phillip Griffiths,Joseph Daniel Harris,2013-11-11 In recent years there has been enormous activity in the theory of algebraic curves Many long standing problems have been solved using the general techniques developed in algebraic geometry during the 1950 s and 1960 s Additionally unexpected and deep connections between algebraic curves and differential equations have been uncovered and these in turn shed light on other classical problems in curve theory It seems fair to say that the theory of algebraic curves looks completely different now from how it appeared 15 years ago in particular our current state of knowledge repre sents a significant advance beyond the legacy left by the classical geometers such as Noether Castelnuovo Enriques and Severi These books give a presentation of one of the central areas of this recent activity namely the study of linear series on both a fixed curve Volume I and on a variable curve Volume II Our goal is to give a comprehensive and self contained account of the extrinsic geometry of algebraic curves which in our opinion constitutes the main geometric core of the recent advances in curve theory Along the way we shall of course discuss appli cations of the theory of linear series to a number of classical topics e g the geometry of the Riemann theta divisor as well as to some of the current research e g the Kodaira dimension of the moduli space of curves **Classical Potential Theory and Its Probabilistic Counterpart** J. L. Doob,2012-12-06 Potential theory and certain aspects of probability theory are intimately related perhaps most obviously in that the transition function determining a Markov process can be used to define the Green function of a potential theory Thus it is possible to define and develop many potential theoretic concepts probabilistically a procedure potential theorists observe withjaun diced eyes in view of the fact that now as in the past their subject provides the motivation for much of Markov process theory However that may be it is clear that certain concepts in potential theory correspond closely to concepts in probability theory specifically to concepts in martingale theory For example superharmonic functions correspond to supermartingales More specifically the Fatou type boundary limit theorems in potential theory correspond to supermartingale convergence theorems the limit properties of monotone sequences of superharmonic functions correspond surprisingly closely to limit properties of monotone sequences of super martingales certain positive superharmonic functions supermartingales are called potentials have associated measures in their respective theories and are subject to domination principles inequalities involving the supports of those measures in each theory there is a reduction operation whose properties are the same in the two theories and these reductions induce sweeping balayage of the measures associated with potentials and so on **Lectures on p-adic Differential Equations** Bernard Dwork,2012-12-06 The present work treats p adic properties of solutions of the hypergeometric differential equation d2 d x l x dx c l x c 1 a b x dx ab y 0 2 with a b c in 4 n Zp by constructing the associated Frobenius structure For this construction we draw upon the methods of Alan Adolphson 1 in his 1976 work on Hecke polynomials We are also indebted to him for the

account appearing as an appendix of the relation between this differential equation and certain L functions We are indebted to G Washnitzer for the method used in the construction of our dual theory Chapter 2 These notes represent an expanded form of lectures given at the U L P in Strasbourg during the fall term of 1980 We take this opportunity to thank Professor R Girard and IRMA for their hospitality Our subject p adic analysis was founded by Marc Krasner We take pleasure in dedicating this work to him Contents 1 Introduction 1 The Space L Algebraic Theory 8 2 Dual Theory Algebraic 14 3 Transcendental Theory 33 4 Analytic Dual Theory 48 5 Basic Properties of Operator 73 6 Calculation Modulo p of the Matrix of f h 92 7 Hasse Invariants 108 8 The a a Map 110 9 Normalized Solution Matrix 113 10 Nilpotent Second Order Linear Differential Equations with Fuchsian Singularities 137 11 Second Order Linear Differential Equations Modulo Powers ofp

Linear Analysis and Representation Theory Steven A. Gaal,2012-12-06 In an age when more and more items are made to be quickly disposable or soon become obsolete due to either progress or other man caused reasons it seems almost anachronistic to write a book in the classical sense A mathematics book becomes an indespensible companion if it is worthy of such a relation not by being rapidly read from cover to cover but by frequent browsing consultation and other occasional use While trying to create such a work I tried not to be encyclopedic but rather select only those parts of each chosen topic which I could present clearly and accurately in a formulation which is likely to last The material I chose is all mathematics which is interesting and important both for the mathematician and to a large extent also for the mathematical physicist I regret that at present I could not give a similar account on direct integrals and the representation theory of certain classes of Lie groups I carefully kept the level of presentation throughout the whole book as uniform as possible Certain introductory sections are kept shorter and are perhaps slightly more detailed in order to help the newcomer prog ress with it at the same rate as the more experienced person is going to proceed with his study of the details **Theory of Incomplete Cylindrical Functions and their Applications** Matest M. Agrest,Michail S. Maksimov,2013-11-11 In preparing the English edition of this unique work every effort has been made to obtain an easily read and lueid exposition of the material This has frequently been done at the expense of a literal translation of the original text and it is felt that such liberties as have been taken with the author s language are justified in the interest of ease in readingo None of us pretends to be an authority in the Russian language and we trust that the original intent of the authors has not been lost The equations whieh were for the most part taken verbatim from the original work were eheeked only eursorily obvious and previously noted errors have been eorreeted Fortunately the Russian and English mathematieal notations are generally in good agreement An exeeption is the shortened abbreviations for the hyperbolie functions e g sh for sinh and the symbol Jm rather that Im to denote the imaginary part As near as possible these diserepaneies have been correeted In preparing the Bibliography works having an English equivalent have been translated into the English title but in the text the referenee to the Russian work was retained as it was impraetieal to attempt to find in eaeh ease the eorresponding eitation in the English edition Authors names and titles

associated with purely Russian works have been transliterated as nearly as possible to the English equivalent along with the equivalent English title of the work cited   Functional Analysis Kosaku Yosida,2013-03-09 The present book is based on lectures given by the author at the University of Tokyo during the past ten years It is intended as a textbook to be studied by students on their own or to be used in a course on Functional Analysis i e the general theory of linear operators in function spaces together with salient features of its application to diverse fields of modern and classical analysis Necessary prerequisites for the reading of this book are summarized with or without proof in Chapter 0 under titles Set Theory Topo logical Spaces Measure Spaces and Linear Spaces Then starting with the chapter on Semi norms a general theory of Banach and Hilbert spaces is presented in connection with the theory of generalized functions of S L SOBOLEV and L SCHWARTZ While the book is primarily addressed to graduate students it is hoped it might prove useful to research mathe maticians both pure and applied The reader may pass e g from Chapter IX Analytical Theory of Semi groups directly to Chapter XIII Ergodic Theory and Diffusion Theory and to Chapter XIV Integration of the Equation of Evolution Such materials as Weak Topologies and Duality in Locally Convex Spaces and Nuclear Spaces are presented in the form of the appendices to Chapter V and Chapter X respectively These might be skipped for the first reading by those who are interested rather in the application of linear operators   **Catalog of Copyright Entries.     Introduction to Quadratic Forms Onorato Timothy O'Meara,2013-12-01   Problems and Theorems in Analysis I George Polya,Gabor Szegö,2012-12-06 From the reviews The work is one of the real classics of this century it has had much influence on teaching on research in several branches of hard analysis particularly complex function theory and it has been an essential indispensable source book for those seriously interested in mathematical problems These volumes contain many extraordinary problems and sequences of problems mostly from some time past well worth attention today and tomorrow Written in the early twenties by two young mathematicians of outstanding talent taste breadth perception perseverence and pedagogical skill this work broke new ground in the teaching of mathematics and how to do mathematical research Bulletin of the American Mathematical Society   *Lectures on Algebraic Topology* Albrecht Dold,2012-12-06 This is essentially a book on singular homology and cohomology with special emphasis on products and manifolds It does not treat homotopy theory except for some basic notions some examples and some applica tions of co homology to homotopy Nor does it deal with general ised homology but many formulations and arguments on singular homology are so chosen that they also apply to general homology Because of these absences I have also omitted spectral sequences their main applications in topology being to homotopy and general co homology theory Cech cohomology is treated in a simple ad hoc fashion for locally compact subsets of manifolds a short systematic treatment for arbitrary spaces emphasizing the universal property of the Cech procedure is contained in an appendix The book grew out of a one year s course on algebraic topology and it can serve as a text for such a course For a shorter basic course say of half a year one might use chapters II III IV 1 4 V 1 5 7 8 VI 3 7 9

11 12 As prerequisites the student should know the elementary parts of general topology abelian group theory and the language of categories although our chapter I provides a little help with the latter two For pedagogical reasons I have treated integral homology only up to chapter VI if a reader or teacher prefers to have general coefficients from the beginning he needs to make only minor adaptions   Models and Modelers of Hydrogen Akhlesh Lakhtakia,1996 Atomic theory began more than two and a half millenia ago in Greece and India but scientific details have emerged albeit very rapidly only in our century This book conveys a glimpse of the grandeur of 20th century physics through nine essays and one interview on the models and modelers of a basic element of matter the hydrogen atom The basic ideas are simply presented and illustrated the mathematical treatments are of a tutorial nature and facsimile reproductions of ten key papers are included Using the simple hydrogen atom educators may use this book to initiate high school students into the grandeur of physics or motivate university students to become science literate   *Harmonic Analysis on Semi-Simple Lie Groups II* Garth Warner,2012-12-06   *The Isometric Theory of Classical Banach Spaces* H.E. Lacey,2012-12-06 The purpose of this book is to present the main structure theorems in the isometric theory of classical Banach spaces Elements of general topology measure theory and Banach spaces are assumed to be familiar to the reader A classical Banach space is a Banach space X whose dual space is linearly isometric to Lp j1 IR or Lp j1 CC in the complex case for some measure j1 and some 1 p 00 If 1   **Elliptic Curves** S. Lang,1978-11-01 It is possible to write endlessly on elliptic curves This is not a threat We deal here with diophantine problems and we lay the foundations especially for the theory of integral points We review briefly the analytic theory of the Weierstrass function and then deal with the arithmetic aspects of the addition formula over complete fields and over number fields giving rise to the theory of the height and its quadraticity We apply this to integral points covering the inequalities of diophantine approximation both on the multiplicative group and on the elliptic curve directly Thus the book splits naturally in two parts The first part deals with the ordinary arithmetic of the elliptic curve The transcendental parametrization the p adic parametrization points of finite order and the group of rational points and the reduction of certain diophantine problems by the theory of heights to diophantine inequalities involving logarithms The second part deals with the proofs of selected inequalities at least strong enough to obtain the finiteness of integral points   Lectures on Closed Geodesics W. Klingenberg,2012-12-06 The question of existence of c10sed geodesics on a Riemannian manifold and the properties of the corresponding periodic orbits in the geodesic flow has been the object of intensive investigations since the beginning of global differential geo metry during the last century The simplest case occurs for c10sed surfaces of negative curvature Here the fundamental group is very large and as shown by Hadamard Had in 1898 every non null homotopic c10sed curve can be deformed into a c10sed curve having minimallength in its free homotopy c1ass This minimal curve is up to the parameterization uniquely determined and represents a c10sed geodesic The question of existence of a c10sed geodesic on a simply connected c10sed surface is much more difficult As pointed out by Poincare po 1 in 1905 this problem has much in

common with the problem ofthe existence of periodic orbits in the restricted three body problem Poincare l c outlined a proof that on an analytic convex surface which does not differ too much from the standard sphere there always exists at least one c10sed geodesic of elliptic type i e the corres ponding periodic orbit in the geodesic flow is infinitesimally stable

Univalent Functions P. L. Duren,2001-07-02   **Algebraic Systems** Anatolij Ivanovic Mal'cev,2012-12-06 As far back as the 1920 s algebra had been accepted as the science studying the properties of sets on which there is defined a particular system of operations However up until the forties the overwhelming majority of algebraists were investigating merely a few kinds of algebraic structures These were primarily groups rings and lattices The first general theoretical work dealing with arbitrary sets with arbitrary operations is due to G Birkhoff 1935 During these same years A Tarski published an important paper in which he formulated the basic prin ciples of a theory of sets equipped with a system of relations Such sets are now called models In contrast to algebra model theory made abun dant use of the apparatus of mathematical logic The possibility of making fruitful use of logic not only to study universal algebras but also the more classical parts of algebra such as group theory was dis covered by the author in 1936 During the next twenty five years it gradually became clear that the theory of universal algebras and model theory are very intimately related despite a certain difference in the nature of their problems And it is therefore meaningful to speak of a single theory of algebraic systems dealing with sets on which there is defined a series of operations and relations algebraic systems The formal apparatus of the theory is the language of the so called applied predicate calculus Thus the theory can be considered to border on logic and algebra   **Abstract Harmonic Analysis** Edwin Hewitt,Kenneth A. Ross,2012-12-06 The book is based on courses given by E Hewitt at the University of Washington and the University of Uppsala The book is intended to be readable by students who have had basic graduate courses in real analysis set theoretic topology and algebra That is the reader should know elementary set theory set theoretic topology measure theory and algebra The book begins with preliminaries in notation and terminology group theory and topology It continues with elements of the theory of topological groups the integration on locally compact spaces and invariant functionals The book concludes with convolutions and group representations and characters and duality of locally compact Abelian groups   **Arithmetic Functions and Integer Products** P.D.T.A. Elliott,2012-12-06 Every positive integer m has a product representation of the form where v k and the ni are positive integers and each Ei I A value can be given for v which is uniform in the m A representation can be computed so that no ni exceeds a certain fixed power of 2m and the number k of terms needed does not exceed a fixed power of log 2m Consider next the collection of finite probability spaces whose associated measures assume only rational values Let hex be a real valued function which measures the information in an event depending only upon the probability x with which that event occurs Assuming hex to be non negative and to satisfy certain standard properties it must have the form A x log x I x 10g I x Except for a renormalization this is the well known function of Shannon What do these results have in common They both apply the theory of arithmetic functions

The two widest classes of arithmetic functions are the real valued additive and the complex valued multiplicative functions Beginning in the thirties of this century the work of Erdos Kac Kubilius Turan and others gave a discipline to the study of the general value distribution of arithmetic func tions by the introduction of ideas methods and results from the theory of Probability I gave an account of the resulting extensive and still developing branch of Number Theory in volumes 239 240 of this series under the title Probabilistic Number Theory
