C++ Cookbook D. Ryan Stephens, 2006 Solutions and examples for C programmers Cover *Principles of Digital Image Processing* Wilhelm Burger, Mark J. Burge, 2010-07-08 This is the second volume of a book series that provides a modern algorithmic introduction to digital image processing. It is designed to be used both by learners desiring a firm foundation on which to build and practitioners in search of critical analysis and modern implementations of the most important techniques. This updated and enhanced paperback edition of our comprehensive textbook *Digital Image Processing: An Algorithmic Approach Using Java* packages the original material into a series of compact volumes thereby supporting a flexible sequence of courses in digital image processing. Tailoring the contents to the scope of individual semester courses is also an attempt to provide affordable and backpack-compatible textbooks without compromising the quality and depth of content. This second volume titled *Core Algorithms* extends the introductory material presented in the first volume *Fundamental Techniques* with additional techniques that are nevertheless part of the standard image processing toolbox. A forthcoming third volume *Advanced Techniques* will extend this series and add important material beyond the elementary level suitable for an advanced undergraduate or even graduate course. Digital Image Processing Wilhelm Burger, Mark J. Burge, 2009-11-14 Written as an introduction for undergraduate students, this textbook covers the most important methods in digital image processing. Formal and mathematical aspects are discussed at a fundamental level and various practical examples and exercises supplement the text. The book uses the image processing environment ImageJ, freely distributed by the National Institute of Health. A comprehensive website supports the book and contains full source code for all examples in the book, a question and answer forum, slides for instructors, etc. *Digital Image Processing in Java* is the definitive textbook for computer science students studying image processing and digital processing. **Credit Risk Modeling using Excel and VBA** Gunter Löffler, Peter N. Posch, 2011-01-31 It is common to blame the inadequacy of credit risk models for the fact that the financial crisis has caught many market participants by surprise. On closer inspection, though, it often appears that market participants failed to understand or to use the models correctly. The recent events therefore do not invalidate traditional credit risk modeling as described in the first edition of the book. A second edition is timely, however, because the first dealt relatively briefly with instruments featuring prominently in the crisis: CDSs and CDOs. In addition to expanding the coverage of these instruments, the book will focus on modeling aspects which were of particular relevance in the financial crisis, e.g., estimation error and demonstrate the usefulness of credit risk modelling through case studies. This book provides practitioners and students with an intuitive, hands-on introduction to modern credit risk modelling. Every chapter starts with an explanation of the methodology and then the authors take the reader step by step through the implementation of the methods in Excel and VBA. They focus specifically on risk management issues and cover default probability estimation, scoring, structural models and transition matrices, correlation and portfolio analysis, validation as well as credit default swaps and structured finance.

The book has an accompanying website <https://creditriskmodeling.wordpress.com> which has been specially updated for this Second Edition and contains slides and exercises for lecturers

Smoothing Techniques Wolfgang Härdle, 2012-12-06 The author has attempted to present a book that provides a non technical introduction into the area of non parametric density and regression function estimation The application of these methods is discussed in terms of the S computing environment Smoothing in high dimensions faces the problem of data sparseness A principal feature of smoothing the averaging of data points in a prescribed neighborhood is not really practicable in dimensions greater than three if we have just one hundred data points Additive models provide a way out of this dilemma but for their interactivensness and recursiveness they require highly effective algorithms For this purpose the method of WARPing Weighted Averaging using Rounded Points is described in great detail
