Spectral Line Formation:

Progress in Stellar Spectral Line Formation Theory J.E. Beckman, L. Crivellari, 2012-12-06 Spectral line formation theory is at the heart of astrophysical diagnostic. Our knowledge of abundances in both stellar and interstellar contexts comes almost entirely from line analysis as does a major fraction of our ability to model stellar atmospheres. As new facets of the universe become observable so the techniques of high resolution spectroscopy are brought to bear with great reward. Improved instruments such as echelle spectrographs employing detectors of high quantum efficiency have revolutioned our ability to observe high quality line profiles although until now this ability has been confined to the brightest stars. Fabry Perot interferometers and their modern derivatives are bringing new ranges of resolving power to studies of atomic and ionic interstellar lines and of course radio techniques imply exceedingly high resolution for the cool interstellar medium of molecules and radicals. Telescopes in space are extending the spectral range of these types of observations. Already the Copernicus and IUE high resolution spectrographs have given us a tantalizing glimmer of what it will be like to obtain ultraviolet spectra with resolution and signal to noise ratio approaching those obtainable on the ground. Fairly soon Space Telescope will be producing high resolution spectroscopic data of unparalleled quality and distance range. As often happens in astrophysics the challenge is now coming from the observers to the theorists to provide interpretational tools which are adequate to the state of the data.

Spectral Line Formation John T. Jefferies, 1968 The purpose of this book is to discuss certain aspects of the theory of the formation and analysis of the line spectrum of a hot gas. The underlying motivation for most of the studies discussed here lies in a desire to develop a physically sound procedure for interpreting the line spectrum of a stellar atmosphere correspondingly the major emphasis is given to problems encountered in astrophysics.

Exoplanet Atmospheres Sara Seager, 2010-08-02 Over the past twenty years astronomers have identified hundreds of extrasolar planets orbiting stars other than the sun. Recent research in this burgeoning field has made it possible to observe and measure the atmospheres of these exoplanets. This is the first textbook to describe the basic physical processes including radiative transfer, molecular absorption and chemical processes common to all planetary atmospheres as well as the transit, eclipse and thermal phase variation observations that are unique to exoplanets. In each chapter Sara Seager offers a conceptual introduction, examples that combine the relevant physics equations with real data and exercises. Topics range from foundational knowledge such as the origin of atmospheric composition and planetary spectra to more advanced concepts such as solutions to the radiative transfer equation, polarization and molecular and condensate opacities. Since planets vary widely in their atmospheric properties Seager emphasizes the major physical processes that govern all planetary atmospheres. Moving from first principles to cutting edge research, *Exoplanet Atmospheres* is an ideal resource for students and researchers in astronomy and earth sciences, one that will help prepare them for the next generation of planetary science. The first textbook to describe exoplanet atmospheres. Illustrates concepts using examples grounded in real data. Provides a

Planets, Stars and Nebulae Studied with Photopolarimetry Tom Gehrels, 2018-01-30 The polarization study of celestial objects is a valuable part of optical astronomy and the author has done exceptionally well in bringing together contributions treating all aspects of the polarimetry field The first section contains a fine introduction and an excellent and definitive history of the subject The volume is well illustrated Highly recommended Choice The high quality of this book is clearly due to strict editorial attention to each paper and the discussions Gehrels's book will surely stand for many years as the fundamental reference source for polarization studies in astronomy as well as in atmospheric physics

Gethyn Timothy, Klaus Wilhelm, Alex Zehnder, 2013-12-11 An ideal resource for lecturers this book provides a comprehensive review of experimental space astronomy The number of astronomers whose knowledge and interest is concentrated on interpreting observations has grown substantially in the past decades yet the number of scientists who are familiar with and capable of dealing with instrumentation has dwindled All of the authors of this work are leading and experienced experts and practitioners who have designed built tested calibrated launched and operated advanced observing equipment for space astronomy This book also contains concise information on the history of the field supported by appropriate references Moreover scientists working in other fields will be able to get a quick overview of the salient issues of observing photons in any one of the various energy wavelength and frequency ranges accessible in space This book was written with the intention to make it accessible to advanced undergraduate and graduate students

Presidents of the forty Commissions of the International Astronomical Union it refers to the progress in our discipline during the three years 1970 1971 and 1972 As compared to earlier volumes a gradual change in character is unmistakable The ever increasing flow of publications combined with the obvious necessity to keep the Reports at a reasonable size and price level has gradually forced the Commission Presidents to be more selective than before in drafting their Reports I have certainly stimulated them into that direction in order that Reports like these be valuable and lasting it seems imperative that the individual contributions have the character of a critical overall review where a fairly complete summary is given of the major developments and discoveries of the past three years and in which the broad developments and new trends be clearly outlined while at the same time essential problems for future research are identified With respect to the latter item I have suggested the Commission Presidents to add to their reports a brief section on scientific priorities for future research in the field of their Commissions In order to save space I have suggested to Commission Presidents that references to published papers are given on the basis of their number in the published issues of Astronomy and Astrophysics Abstracts For instance the indication 06 078 019 or AAA 06 078
