Iron-Sulfur Clusters in Chemistry and Biology Tracey Rouault, 2014-08-20 This volume on iron sulfur proteins includes chapters that describe the initial discovery of iron sulfur proteins in the 1960s to elucidation of the roles of iron sulfur clusters as prosthetic groups of enzymes such as the citric acid cycle enzyme aconitase and numerous other proteins ranging from nitrogenase to DNA repair proteins The capacity of iron sulfur clusters to accept and delocalize single electrons is explained by basic chemical principles which illustrate why iron sulfur proteins are uniquely suitable for electron transport and other activities Techniques used for detection and stabilization of iron sulfur clusters including EPR and Mossbauer spectroscopies are discussed because they are important for characterizing unrecognized and elusive iron sulfur proteins Recent insights into how nitrogenase works have arisen from multiple advances described here including studies of high resolution crystal structures Numerous chapters discuss how microbes plants and animals synthesize these complex prosthetic groups and why it is important to understand the chemistry and biogenesis of iron sulfur proteins In addition to their vital importance in mitochondrial respiration numerous iron sulfur proteins are important in maintenance of DNA integrity Multiple rare human diseases with different clinical presentations are caused by mutations of genes in the iron sulfur cluster biogenesis pathway Understanding iron sulfur proteins is important for understanding a rapidly expanding group of metabolic pathways important in all kingdoms of life and for understanding processes ranging from nitrogen fixation to human disease

Trends in Human Hair Growth and Alopecia Research Dominique van Neste,J.M. Lachapelle,J.L. Antoine,2012-12-06 It is now thirty years since William Montagna and Richard Ellis edited The Biology of Hair Growth In his

introduction Stephen Rothman of the University of Chicago USA and one of the driving forces behind research on skin at the time wrote The pilary system is a perfect microcosmic structure In this microcosmos we find birth development ageing and death activity and rest color formation and decolorification greasiness and dryness infection and sterilization hypertrophy and atrophy Benign tumours and malignant ones He foresaw the human pilary system as a model for the study of a multitude of human diseases including ageing and cancer It was not however until the seventies that the development of micro biochemical techniques indeed allowed the use of the human hair follicle as a convenient biopsy tissue for Biomedical Research in general Measurement of enzyme activities and important cofactors and culturing of cells from single follicles all became possible In the eighties dermal papilla cells were grown in culture and this opened the way to study hair differentiation in vitro Studying hair differentiation is in fact studying growth regulation and it is this aspect that by far transcends the importance of studying hair growth itself Let us not forget that metastatic prostate cancer is treated with the same drug cyproterone acetate that is used for the treatment of alopecia and hirsutism in women
