Symposia Mathematica Volume 1:

Symposia Mathematica, 1969 Literature 1970, Part 1 Siegfried Böhme, Walter Fricke, Ulrich Güntzel-Lingner, Frieda Henn, Dietlinde Krahn, Gert Zech, 2013-04-18 Astronomy and Astrophysics Abstracts which appears in semi annual volumes is devoted to the recording summarizing and indexing of astronomical publications throughout the world It is prepared under the auspices of the International Astronomical Union according to a resolution adopted at the 14th General Assembly in 1970 Astronomy and Astrophysics Abstracts aims to present a comprehensive documentation of literature in all fields of astronomy and astrophysics Every effort will be made to ensure that the average time interval between the date of receipt of the original literature and publication of the abstracts will not exceed eight months This time interval is near to that achieved by monthly abstracting journals compared to which our system of accumulating abstracts for about six months offers the advantage of greater convenience for the user Volume 3 contains literature published in 1970 and received before August IS 1970 some older literature which was received late and which is not recorded in earlier volumes is also included **Imprimitive**

Irreducible Modules for Finite Quasisimple Groups Gerhard Hiss, William J. Husen, Kay Magaard, 2015-02-06 Motivated by the maximal subgroup problem of the finite classical groups the authors begin the classification of imprimitive irreducible modules of finite quasisimple groups over algebraically closed fields K A module of a group G over K is imprimitive if it is induced from a module of a proper subgroup of G The authors obtain their strongest results when $\text{char } K = 0$ although much of their analysis carries over into positive characteristic If G is a finite quasisimple group of Lie type they prove that an imprimitive irreducible KG module is Harish Chandra induced This being true for $\text{rm char } K$ different from the defining characteristic of G the authors specialize to the case $\text{char } K = 0$ and apply Harish Chandra philosophy to classify irreducible Harish Chandra induced modules in terms of Harish Chandra series as well as in terms of Lusztig series The authors determine the asymptotic proportion of the irreducible imprimitive KG modules when G runs through a series groups of fixed twisted Lie type One of the surprising outcomes of their investigations is the fact that these proportions tend to 1 if the Lie rank of the groups tends to infinity For exceptional groups G of Lie type of small rank and for sporadic groups G the authors determine all irreducible imprimitive KG modules for arbitrary characteristic of K *The q -theory of Finite Semigroups* John Rhodes, Benjamin Steinberg, 2009-04-05 Discoveries in finite semigroups have influenced several mathematical fields including theoretical computer science tropical algebra via matrix theory with coefficients in semirings and other areas of modern algebra This comprehensive encyclopedic text will provide the reader from the graduate student to the researcher practitioner with a detailed understanding of modern finite semigroup theory focusing in particular on advanced topics on the cutting edge of research Key features 1 Develops q theory a new theory that provides a unifying approach to finite semigroup theory via quantization 2 Contains the only contemporary exposition of the complete theory of the complexity of finite semigroups 3 Introduces spectral theory into finite semigroup theory 4 Develops the theory of profinite semigroups

from first principles making connections with spectra of Boolean algebras of regular languages 5 Presents over 70 research problems most new and hundreds of exercises Additional features 1 For newcomers an appendix on elementary finite semigroup theory 2 Extensive bibliography and index The q theory of Finite Semigroups presents important techniques and results many for the first time in book form and thereby updates and modernizes the literature of semigroup theory

Geometric Quantization and Quantum Mechanics Jędrzej Sniatycki, 2012-12-06 This book contains a revised and expanded version of the lecture notes of two seminar series given during the academic year 1976-77 at the Department of Mathematics and Statistics of the University of Calgary and in the summer of 1978 at the Institute of Theoretical Physics of the Technical University Clausthal The aim of the seminars was to present geometric quantization from the point of view of its applications to quantum mechanics and to introduce the quantum dynamics of various physical systems as the result of the geometric quantization of the classical dynamics of these systems The group representation aspects of geometric quantization as well as proofs of the existence and the uniqueness of the introduced structures can be found in the expository papers of Blattner Kostant Sternberg and Wolf and also in the references quoted in these papers The books of Souriau 1970 and Simms and Woodhouse 1976 present the theory of geometric quantization and its relationship to quantum mechanics The purpose of the present book is to complement the preceding ones by including new developments of the theory and emphasizing the computations leading to results in quantum mechanics Topological and Bivariant K-Theory Joachim Cuntz, Jonathan Rosenberg, 2007-07-19 Topological K theory is one of the most important invariants for noncommutative algebras Bott periodicity homotopy invariance and various long exact sequences distinguish it from algebraic K theory This book describes a bivariant K theory for bornological algebras which provides a vast generalization of topological K theory In addition it details other approaches to bivariant K theories for operator algebras The book studies a number of applications including K theory of crossed products the Baum Connes assembly map twisted K theory with some of its applications and some variants of the Atiyah Singer Index Theorem **Geometry and Topology of Submanifolds and**

Forcing, Arithmetic, Division Rings J. Hirschfeld, W.H. Wheeler, 2006-11-15 **The Global Theory of Minimal Surfaces in Flat Spaces** William Meeks, A. Ros, H. Rosenberg, 2002-03-25 In the second half of the twentieth century the global theory of minimal surface in flat space had an unexpected and rapid blossoming Some of the classical problems were solved and new classes of minimal surfaces found Minimal surfaces are now studied from several different viewpoints using methods and techniques from analysis real and complex topology and geometry In this lecture course Meeks Ros and Rosenberg three of the main architects of the modern edifice present some of the more recent methods and developments of the theory The topics include moduli asymptotic geometry and surfaces of constant mean curvature in the hyperbolic space

Rational Number Theory in the 20th Century Władysław Narkiewicz, 2011-09-02 The last one hundred years have seen many important achievements in the classical part of number theory After the proof of the Prime Number Theorem in 1896 a quick development of analytical tools led to the invention of various new methods like Brun's sieve method and the circle method of Hardy Littlewood and Ramanujan developments in topics such as prime and additive number theory and the solution of Fermat's problem Rational Number Theory in the 20th Century From PNT to FLT offers a short survey of 20th century developments in classical number theory documenting between the proof of the Prime Number Theorem and the proof of Fermat's Last Theorem The focus lays upon the part of number theory that deals with properties of integers and rational numbers Chapters are divided into five time periods which are then further divided into subject areas With the introduction of each new topic developments are followed through to the present day This book will appeal to graduate researchers and student in number theory however the presentation of main results without technicalities will make this accessible to anyone with an interest in the area

Integer Programming and Related Areas Rabe v. Randow, 2012-12-06 The fields of integer programming and combinatorial optimization continue to be areas of great vitality with an ever increasing number of publications and journals appearing A classified bibliography thus continues to be necessary and useful today even more so than it did when the project of which this is the fifth volume was started in 1970 in the Institut für Ökonometrie und Operations Research of the University of Bonn The pioneering first volume was compiled by

Claus Kastning during the years 1970 1975 and appeared in 1976 as Volume 128 of the series Lecture Notes in Economics and Mathematical Systems published by the Springer Verlag Work on the project was continued by Dirk Hausmann Reinhardt Euler and Rabe von Randow and resulted in the publication of the second third and fourth volumes in 1978 1982 and 1985 Volumes 160 197 and 243 of the above series The present book constitutes the fifth volume of the bibliography and covers the period from autumn 1984 to the end of 1987 It contains 5864 new publications by 4480 authors and was compiled by Rabe von Randow Its form is practically identical to that of the first four volumes some additions having been made to the subject list

Semidynamical Systems in Infinite Dimensional Spaces Stephen H. Saperstone, 2012-12-06 Where do solutions go and how do they behave en route These are two of the major questions addressed by the qualitative theory of differential equations The purpose of this book is to answer these questions for certain classes of equations by recourse to the framework of semidynamical systems or topological dynamics as it is sometimes called This approach makes it possible to treat a seemingly broad range of equations from nonautonomous ordinary differential equations and partial differential equations to stochastic differential equations The methods are not limited to the examples presented here though The basic idea is this Embed some representation of the solutions of the equation and perhaps the equation itself in an appropriate function space This space serves as the phase space for the semidynamical system The phase map must be chosen so as to generate solutions to the equation from an initial value In most instances it is necessary to provide a weak topology on the phase space Typically the space is infinite dimensional These considerations motivate the requirement to study semidynamical systems in non locally compact spaces Our objective here is to present only those results needed for the kinds of applications one is likely to encounter in differential equations Additional properties and extensions of abstract semidynamical systems are left as exercises The power of the semidynamical framework makes it possible to characterize the asymptotic behavior of the solutions of such a wide class of equations
