Symmetries of Spacetimes and Riemannian Manifolds Krishan L. Duggal,Ramesh Sharma,2013-11-22 This book provides an upto date information on metric connection and curva ture symmetries used in geometry and physics More specifically we present the characterizations and classifications of Riemannian and Lorentzian manifolds in particular the spacetimes of general relativity admitting metric i e Killing ho mothetic and conformal connection i e affine conformal and projective and curvature symmetries Our approach in this book has the following outstanding features a It is the first ever attempt of a comprehensive collection of the works of a very large number of researchers on all the above mentioned symmetries b We have aimed at bringing together the researchers interested in differential geometry and the mathematical physics of general relativity by giving an invariant as well as the index form of the main formulas and results c Attempt has been made to support several main mathematical results by citing physical example s as applied to general relativity d Overall the presentation is self contained fairly accessible and in some special cases supported by an extensive list of cited references e The material covered should stimulate future research on symmetries Chapters 1 and 2 contain most of the prerequisites for reading the rest of the book We present the language of semi Euclidean spaces manifolds their tensor calculus geometry of null curves non degenerate and degenerate light like hypersurfaces All this is described in invariant as well as the index form *Symmetries of Spacetimes and Riemannian Manifolds* Krishan Duggal,Ramesh Sharma,2014-09-01 *Advances in Differential Geometry and General Relativity* John K. mechanics field theory and general relativity and in addition acquire the necessary calculational skills to tackle more sophisticated questions in theoretical physics Most of the topics covered in this book have previously only been scattered across many different sources of literature therefore this is the first book to coherently present this treatment of topics in one comprehensive volume Key features Contains a modern streamlined presentation of classical topics which are normally taught separately Includes several advanced topics such as the Belinfante energy momentum tensor the Weyl Schouten theorem the derivation of Noether currents for diffeomorphisms and the definition of conserved integrals in general relativity Focuses on the clear presentation of the mathematical notions and calculational technique *Differentiable and Complex Dynamics of Several Variables* Pei-Chu Hu,Chung-Chun Yang,2013-04-17 The development of dynamics theory began with the work of Isaac Newton In his theory the most basic law of classical mechanics is f ma which describes the motion n in IR of a point of mass m under the action of a force f by giving the acceleration a If n the position of the point is taken to be a point x E IR and if the force f is supposed to be a function of x only Newton s Law is a description in terms of a second order ordinary differential equation J2x m dt f x 2 It makes sense to reduce the equations to first order by defining the velo city as an extra n independent variable by v i E IR Then x v mv f x L Euler J L Lagrange and others studied mechanics by means of an analytical method called analytical dynamics Whenever the force f is represented by a gradient vector field f lU of the potential energy U and denotes the difference of the kinetic energy and the potential energy by 1 L x v 2 m v v U x the Newton equation of motion is reduced to the Euler Lagrange equation are used as the variables the Euler Lagrange equation can be If the momenta y written as 8L y 8x Further W R **Operational Symmetries** Heinrich Saller,2017-06-19 This book describes the endeavour to relate the particle spectrum with representations of operational electroweak spacetime in analogy to the atomic spectrum as characterizing representations of hyperbolic space The spectrum of hyperbolic position space explains the properties of the nonrelativistic atoms the spectrum of electroweak spacetime is hoped to explain those of the basic interactions and elementary particles In this book the theory of operational symmetries is developed from the numbers from Plato s and Kepler s symmetries over the simple Lie groups to their applications in nonrelativistic special relativistic and general relativistic quantum theories with the atomic spectrum for hyperbolic position and in first attempts the particle spectrum for electroweak spacetime The standard model of elementary particles and interactions is characterized by a symmetry group In general as initiated by Weyl and stressed by Heisenberg quantum theory can be built as a theory of operation groups and their unitary representations In such a framework time position and spacetime is modeled by equivalence classes of symmetry groups For a unification on this road the quest is not for a final theory with a basic equation for basic particles but for the basic operation group and its representations **The Tenth Marcel Grossmann Meeting** M.
