Symmetry And Topology In Chemical Reactivity:

Symmetry and Topology in Chemical Reactivity Pieter E. Schipper, 1994 This well illustrated book develops using only the ideas of basic quantum chemistry e g perturbation and symmetry theory a fundamental conceptual and theoretical framework for chemical reactivity By feeding the role of symmetry and chemical group topology directly into the development the analysis generates and explains the successful features of simpler reactivity theories e g frontier orbital theory the isolobal concept PMO theory the Woodward Hoffmann rules as well as defines their limitations The unifying construct is that of a group resolved correlation diagram which is shown to represent the formal quantization of the electron arrow replacing the concept of classical point electrons moving between groups with the concept of quantum electron matter waves which evolve with the evolving nuclear and chemical group structure The use of the concept of chemical groups functional group system substituents solvents is central to the development localising the evolutionary electrons within the functional groups and leading to an isolation and analytic definition of substituent and solvent catalytic effects as explicit functions of the reaction coordinate Each archetypical reaction family is represented by fully worked examples viz aliphatic nucleophilic substitution aromatic electrophilic substitution inorganic rearrangements electrocyclic additions Diels Alder additions and addition stages in chiral reactions

Chemical Topology D Bonchev, D.H Rouvray, 1999-04-23 Topology is becoming increasingly important in chemistry because of its rapidly growing number of applications Here its many uses are reviewed and the authors anticipate what future developments might bring This work shows how significant new insights can be gained by representing molecular species as topological structures known as topographs The text explores carbon structures establishing how the stability of fullerene species can be accounted for and also predicting which fullerenes will be most stable It is pointed out that molecular topology rather than molecular geometry characterizes molecular shape and various tools for shape characterization are described Several of the fascinating ideas that arise from regarding topology as a unifying principle in chemical bonding theory are discussed and in particular the novel concept of the molecular topoid is shown to have numerous uses The topological description of polymers is examined and the reader is gently guided through the realms of branched and tangled polymers Overall this work outlines the fact that topology is not only a theoretical discipline but also one that has practical applications and high relevance to the whole domain of chemistry

Graph Theoretical Approaches to Chemical Reactivity Danail D. Bonchev, O.G. Mekenyan, 2012-12-06 The progress in computer technology during the last 10 15 years has enabled the performance of ever more precise quantum mechanical calculations related to structure and interactions of chemical compounds However the qualitative models relating electronic structure to molecular geometry have not progressed at the same pace There is a continuing need in chemistry for simple concepts and qualitatively clear pictures that are also quantitatively comparable to ab initio quantum chemical calculations Topological methods and more specifically graph theory

as a fixed point topology provide in principle a chance to fill this gap With its more than 100 years of applications to chemistry graph theory has proven to be of vital importance as the most natural language of chemistry The explosive development of chemical graph theory during the last 20 years has increasingly overlapped with quantum chemistry Besides contributing to the solution of various problems in theoretical chemistry this development indicates that topology is an underlying principle that explains the success of quantum mechanics and goes beyond it thus promising to bear more fruit in the future

Mathematical Models of Chemical Reactions Péter Érdi,János Tóth,1989 *New Frontiers in Nanochemistry: Concepts, Theories, and Trends* Mihai Putz,2020-05-06 New Frontiers in Nanochemistry Concepts Theories and Trends Volume 2 Topological Nanochemistry is the second of the new three volume set that explains and explores the important basic and advanced modern concepts in multidisciplinary chemistry Under the broad expertise of the editor this second volume explores the rich research areas of nanochemistry with a specific focus on the design and control of nanotechnology by structural and reactive topology The objective of this particular volume is to emphasize the application of nanochemistry With 46 entries from eminent international scientists and scholars the content in this volume spans concepts from A to Z from entries on the atom bond connectivity index to the Zagreb indices from connectivity to vapor phase epitaxy and from fullerenes to topological reactivity and much more The definitions within the text are accompanied by brief but comprehensive explicative essays as well as figures tables etc providing a holistic understanding of the concepts presented

Free Radicals in Chemistry and Biology Milan Lazar,1989-03-31 Elementary radical reactions are described in terms of fundamental knowledge of organic chemistry and chemical physics in this valuable reference text The complex radical processes of nonchain and chain mechanisms such as dimerization alkylation polymerization telomerization halogenation pyrolysis oxidation and combustion are complemented by reactions in chemical lasers and in the cosmos as well as by reactions in biological objects under normal or pathological metabolism The text also provides the synthesis of facts from various fields of research and involves mechanisms where free radicals appear either as main or side intermediates in one of the several alternatives of the reaction pathway Highlights include 38 tables and 39 figures *Quantum Theory of Chemical Reactions* R. Daudel,A. Pullman,L. Salem,A. Veillard,2012-12-06 This treatise is devoted to an analysis of the present state of the quantum theory of chemical reactions It will be divided into three volumes and will contain the contributions to an international seminar organized by the editors The first one is concerned with the fundamental problems which occur when studying a gas phase reaction or a reaction for which the solvent effect is not taken into account The two first papers show how the collision theory can be used to predict the behaviour of interacting small molecules For large molecules the complete calculations are not possible We can only estimate the reaction path by calculating important areas of the potential surfaces Four papers are concerned with this important process Furthermore in one of these the electronic reorganization which occurs along the reaction path is carefully analyzed o papers are devoted to the discussion of general rules as

aromaticity rules symmetry rules The last two papers are concerned with the electrostatic molecular potential method which is the modern way of using static indices to establish relations between structure and chemical reactivity Volume II will be devoted to a detailed analysis of the role of the solvent and volume III will present important applications as reaction mechanisms photochemistry catalysis biochemical reactions and drug design

SOME RECENT DEVELOPMENTS IN THE MOLECULAR TREATMENT OF ATOM-ATOM COLLISIONS

Charge Sensitivity Approach to Electronic Structure and Chemical Reactivity Roman F. Nalewajski, Jacek Korchowiec, 1997 Charge Sensitivity Analysis (CSA) represents a linear response treatment of molecular systems based upon the chemical potential and hardness/softness concepts established within density functional theory (DFT). Recently it has been shown to provide an attractive framework leading to novel approaches to chemical reactivity of open systems. The monograph presents the conceptual and methodological basis of the CSA covering its DFT roots, alternative resolutions and representations, sensitivities of closed and open atomic and molecular systems, charge stability criteria and relaxational effects due to the system environment and alternative collective modes of charge redistribution. The CSA interaction energy in donor-acceptor systems is investigated in the second order approximation. In particular, the relaxational contributions to the chemical potential, hardness and softness quantities are examined and their physical implications are summarized. The charge sensitivity concepts for reactive systems include one and two reactant reactivity criteria, mapping relations between equilibrium displacements in the electron population and nuclear position spaces, the intersecting state model of charge transfer processes, intermediate hardness decoupling modes and the minimum energy coordinates all defined in the electron population space. The conceptual developments are illustrated using recent qualitative and quantitative results on selected molecules, catalytic clusters and chemisorption systems. The CSA description is shown to connect directly to intuitive concepts and rules of chemistry, e.g. those related to interactions between hard/soft acids and bases.
