Tanner,1974     **Ground Noise Measurements During Landing, Take-off, and Flyby Operations of a Four-engine Turbopropeller STOL Airplane** David A. Hilton,Herbert R. Henderson,Domenic J. Maglieri,1971 Noise measurements were obtained for a four engine turbopropeller STOL airplane during a Federal Aviation Administration flight evaluation program at the National Aviation Facilities Experimental Center These noise measurements involved landing approach takeoff climbout and flyby operations of the airplane A total of 13 measuring positions were used to define the noise characteristics around a simulated STOL port The results are presented in the form of both physical and subjective measurements An appendix is included to present tabulated values of various subjective reaction units which may be significant for the planning and operation of STOL ports The main source of noise produced by this vehicle was found to be the propeller and noise levels decrease generally in accordance with the inverse distance law for distances up to about 457 meters For similar slant ranges somewhat lower noise levels were experienced during flyby than during takeoff or landing     *Hearings* United States.
