Globalisation and Sustainable Development Vladimir F. Krapivin, 2007-07-05 A characteristic of the present global ecological situation is increasing instability or put another way a crisis in the civilization system the global scale of which is expressed through a deterioration of human and animal habitats The most substantial features of global ecodynamics of the late 20th and early 21st centuries include the rapid increase in world population mainly in developing countries increase in the size of the urban population considerable growth in the number of megalopolises and increase in the scales of such dangerous diseases as HIV AIDS hepatitis tuberculosis etc With growing population size the problems of providing people with food and improving their living conditions in many regions will not only not be resolved but will become even more urgent Any possible benefit from decrease in per capita consumption as a result of increased efficiency of technologies will be outweighed by the impact of such a growth in population size Despite the predominant increase of population in developing countries their contribution to the impact on the environment will not necessarily exceed that of developed countries Key to ensuring sustainable development of the nature society system NSS is the relationship between production and consumption as mentioned at the World Summit on Sustainable Development in Johannesburg 2002 As civilization has developed so the problem of predicting the scale of expected climate change and associated change in human habitats has become more urgent

Shannon O'Lear, 2018-03-12 This thought provoking and clearly argued text provides a critical geopolitical lens for understanding global environment politics A subfield of political geography environmental geopolitics examines how environmental themes are used to support geopolitical arguments and physical realities of power and place Shannon O Lear considers common problematic traits of such familiar but widely misunderstood narratives about human environment relationships Mainstream themes about human environment relationships include narratives about presumed connections between human population trends and resource scarcity ways in which conflict and violence are linked to resource use or environmental degradation climate security and the application of science to solve environmental problems O Lear questions these narratives arguing that the role or meaning of the environment is rarely specified humans role in these situations tends to be considered selectively and little attention is paid to spatial dimensions of human environment relationships She shows that how we tend to think about environmental concerns often obscure value judgments and constrain more dynamic approaches to human environment relationships Environmental geopolitics demonstrates how we can question familiar assumptions to generate more just and creative approaches to our many relationships with the environment Navigating

Sclar, Nicole Volavka-Close, Peter Brown, 2013-05-07 For the first time in

history half of the world s population lives in urban areas and it is expected that by 2050 that figure will rise to above two thirds A large proportion of this urban growth will be taking place in the cities of the developing world where the provision of adequate health shelter water and sanitation and climate change adaptation efforts for rapidly growing urban populations will be an urgent priority This transition to an urban world could be a negative transformation but if well planned it could also offer an unprecedented opportunity to improve the lives of some of the world s poorest people This volume brings together some of the world s foremost experts in urban development with the aim of approaching these issues as an opportunity for real positive change The chapters focus on three strategically critical aspects of this transformation public health shelter water and sanitation climate change adaptation These are considered using an integrated approach that takes
