Evarist Giné, David M. Mason, Jon A. Wellner, 2012-12-06 High dimensional probability in the sense that encompasses the topics represented in this volume began about thirty years ago with research in two related areas limit theorems for sums of independent Banach space valued random vectors and general Gaussian processes An important feature in these past research studies has been the fact that they highlighted the essential probabilistic nature of the problems considered In part this was because by working on a general Banach space one had to discard the extra and often extraneous structure imposed by random variables taking values in a Euclidean space or by processes being indexed by sets in \mathbb{R} or \mathbb{R}^d Doing this led to striking advances particularly in Gaussian process theory It also led to the creation or introduction of powerful new tools such as randomization decoupling moment and exponential inequalities chaining isoperimetry and concentration of measure which apply to areas well beyond those for which they were created The general theory of empirical processes with its vast applications in statistics the study of local times of Markov processes certain problems in harmonic analysis and the general theory of stochastic processes are just several of the broad areas in which Gaussian process techniques and techniques from probability in Banach spaces have made a substantial impact Parallel to this work on probability in Banach spaces classical probability and empirical process theory were enriched by the development of powerful results in strong approximations

Computer Vision and Graphics Leonard Bolc, Ryszard Tadeusiewicz, Leszek J. Chmielewski, Konrad Wojciechowski, 2010-09-14 Annotation This book is part I of a two volume work that contains the refereed proceedings of the International Conference on Computer Vision and Graphics ICCVG 2010 held in Warsaw Poland in September 2010 The 95 revised full papers presented were carefully reviewed and selected from numerous submissions The papers are organized in three topical sections advances in pattern recognition machine vision and image understanding human motion analysis and

synthesis and computer vision and graphics *Markov Processes, Feller Semigroups and Evolution Equations* J. A. van Casteren, 2011 The book provides a systemic treatment of time dependent strong Markov processes with values in a Polish space It describes its generators and the link with stochastic differential equations in infinite dimensions In a unifying way where the square gradient operator is employed new results for backward stochastic differential equations and long time behavior are discussed in depth The book also establishes a link between propagators or evolution families with the Feller property and time inhomogeneous Markov processes This mathematical material finds its applications in several branches of the scientific world among which are mathematical physics hedging models in financial mathematics and population models

Nonlinear Analysis, Differential Equations and Control F.H. Clarke, R.J. Stern, 2012-12-06 Recent years have witnessed important developments in those areas of the mathematical sciences where the basic model under study is a dynamical system such as a differential equation or control process Many of these recent advances were made possible by parallel developments in nonlinear and nonsmooth analysis The latter subjects in general terms encompass differential analysis and optimization theory in the absence of traditional linearity convexity or smoothness assumptions In the last three decades it has become increasingly recognized that nonlinear and nonsmooth behavior is naturally present and prevalent in dynamical models and is therefore significant theoretically This point of view has guided us in the organizational aspects of this ASI Our goals were twofold We intended to achieve cross fertilization between mathematicians who were working in a diverse range of problem areas but who all shared an interest in nonlinear and nonsmooth analysis More importantly it was our goal to expose a young international audience mainly graduate students and recent Ph D s to these important subjects In that regard there were heavy pedagogical demands placed upon the twelve speakers of the ASI in meeting the needs of such a gathering The talks while exposing current areas of research activity were required to be as introductory and comprehensive as possible It is our belief that these goals were achieved and that these proceedings bear this out Each of the twelve speakers presented a mini course of four or five hours duration An Introduction to Analysis on Wiener Space Ali S. Üstünel, 2006-11-14 This book gives the basis of the probabilistic functional analysis on Wiener space developed during the last decade The subject has progressed considerably in recent years through its links with QFT and the impact of Stochastic Calculus of Variations of P Malliavin Although the latter deals essentially with the regularity of the laws of random variables defined on the Wiener space the book focuses on quite different subjects i.e independence Rami's theorem etc First year graduate level in functional analysis and theory of stochastic processes is required stochastic integration with respect to Brownian motion Ito formula etc It can be taught as a 1 semester course as it is or in 2 semesters adding preliminaries from the theory of stochastic processes It is a user friendly introduction to Malliavin calculus On the Foundations of Nonlinear Generalized Functions I and II Michael Grosser, 2001 In part 1 of this title the authors construct a diffeomorphism invariant Colombeau type differential algebra canonically containing the space of distributions in the sense of L Schwartz Employing

differential calculus in infinite dimensional convenient vector spaces previous attempts in this direction are unified and completed Several classification results are achieved and applications to nonlinear differential equations involving singularities are given *Advances in Numerical Simulation in Physics and Engineering* Carlos Parés, Carlos Vázquez, Frédéric Coquel, 2014-07-05 The book is mainly addressed to young graduate students in engineering and natural sciences who start to face numerical simulation either at a research level or in the field of industrial applications The main subjects covered are Biomechanics Stochastic Calculus Geophysical flow simulation and Shock Capturing numerical methods for Hyperbolic Systems of Partial Differential Equations The book can also be useful to researchers or even technicians working at an industrial environment who are interested in the state of the art numerical techniques in these fields Moreover it gives an overview of the research developed at the French and Spanish universities and in some European scientific institutions This book can be also useful as a textbook at master courses in Mathematics Physics or Engineering

Groups of Self-Equivalences and Related Topics Renzo A. Piccinini, 2006-11-14 Since the subject of Groups of Self Equivalences was first discussed in 1958 in a paper of Barcuss and Barratt a good deal of progress has been achieved This is reviewed in this volume first by a long survey article and a presentation of 17 open problems together with a bibliography of the subject and by a further 14 original research articles *Semigroups of Operators: Theory and Applications* A.V. Balakrishnan, 2012-12-06 These Proceedings comprise the bulk of the papers presented at the International Conference on Semigroups of Operators Theory and Control held 14-18 December 1998 Newport Beach California U S A The intent of the Conference was to highlight recent advances in the theory of Semigroups of Operators which provides the abstract framework for the time domain solutions of time invariant boundary value initial value problems of partial differential equations There is of course a firewall between the abstract theory and the applications and one of the Conference aims was to bring together both in the hope that it may be of value to both communities In these days when all scientific activity is judged by its value on dot com it is not surprising that mathematical analysis that holds no promise of an immediate commercial product line or even a software tool box is not high in research priority We are particularly pleased therefore that the National Science Foundation provided generous financial support without which this Conference would have been impossible to organize Our special thanks to Dr Kishan Baheti Program Manager

Quantum Information And Complexity - Proceedings Of The Meijo Winter School 2003 Takeyuki Hida, 2004-10-28 Quantum information is a developing multi disciplinary field with many exciting links to white noise theory This connection is explored and presented in this work which effectively bridges the gap between quantum information theory and complex systems Arising from the Meijo Winter School and International Conference the lecture notes and research papers published in this timely volume will have a significant impact on the future development of the theories of quantum information and complexity This book will be of interest to mathematicians physicists computer scientists as well as electrical engineers working in this field

Geometric Theory of Generalized Functions with Applications to General Relativity M. Grosser, M. Kunzinger, Michael Oberguggenberger, R. Steinbauer, 2013-04-17 Over the past few years a certain shift of focus within the theory of algebras of generalized functions in the sense of J F Colombeau has taken place Originating in infinite dimensional analysis and initially applied mainly to problems in nonlinear partial differential equations involving singularities the theory has undergone a change both in internal structure and scope of applicability due to a growing number of applications to questions of a more geometric nature The present book is intended to provide an in depth presentation of these developments comprising its structural aspects within the theory of generalized functions as well as a selective but as we hope representative set of applications This main purpose of the book is accompanied by a number of subordinate goals which we were aiming at when arranging the material included here First despite the fact that by now several excellent monographs on Colombeau algebras are available we have decided to give a self contained introduction to the field in Chapter 1 Our motivation for this decision derives from two main features of our approach On the one hand in contrast to other treatments of the subject we base our introduction to the field on the so called special variant of the algebras which makes many of the fundamental ideas of the field particularly transparent and at the same time facilitates and motivates the introduction of the more involved concepts treated later in the chapter

Probabilistic Behavior of Harmonic Functions Rodrigo Banuelos, Charles N. Moore, 1999-08 Harmonic analysis and probability have long enjoyed a mutually beneficial relationship that has been rich and fruitful This monograph aimed at researchers and students in these fields explores several aspects of this relationship The primary focus of the text is the nontangential maximal function and the area function of a harmonic function and their probabilistic analogues in martingale theory The text first gives the requisite background material from harmonic analysis and discusses known results concerning the nontangential maximal function and area function as well as the central and essential role these have played in the development of the field The book next discusses further refinements of traditional results among these are sharp good lambda inequalities and laws of the iterated logarithm involving nontangential maximal functions and area functions Many applications of these results are given Throughout the constant interplay between probability and harmonic analysis is emphasized and explained The text contains some new and many recent results combined in a coherent presentation

Lie Algebras and Lie Groups Jean-Pierre Serre, 2009-02-07 This book reproduces J P Serre's 1964 Harvard lectures The aim is to introduce the reader to the Lie dictionary Lie algebras and Lie groups Special features of the presentation are its emphasis on formal groups in the Lie group part and the use of analytic manifolds on p adic fields Some knowledge of algebra and calculus is required of the reader but the text is easily accessible to graduate students and to mathematicians at large
