1 1 AN OVERVIEW OF MARKOV DECISION PROCESSES The theory of Markov Decision Processes also known under several other names including sequential stochastic optimization discrete time stochastic control and stochastic dynamic programming studies sequential optimization of discrete time stochastic systems The basic object is a discrete time stochastic system whose transition mechanism can be controlled over time Each control policy defines the stochastic process and values of objective functions associated with this process The goal is to select a good control policy In real life decisions that humans and computers make on all levels usually have two types of impacts i they cost or save time money or other resources or they bring revenues as well as ii they have an impact on the future by influencing the dynamics In many situations decisions with the largest immediate profit may not be good in view of future events MDPs model this paradigm and provide results on the structure and existence of good policies and on methods for their calculation

Water Resource Systems Planning and Management Daniel P. Loucks, Eelco van Beek, 2017-03-02 This book is open access under a CC BY NC 4.0 license This revised updated textbook presents a systems approach to the planning management and operation of water resources infrastructure in the environment Previously published in 2005 by UNESCO and Deltares Delft Hydraulics at the time this new edition written again with contributions from Jery R Stedinger Jozef P M Dijkman and Monique T Villars is aimed equally at students and professionals It introduces readers to the concept of viewing issues involving water resources as a system of multiple interacting components and scales

It offers guidelines for initiating and carrying out water resource system planning and management projects. It introduces alternative optimization simulation and statistical methods useful for project identification, design, siting, operation, and evaluation, and for studying post planning issues. The authors cover both basin wide and urban water issues and present ways of identifying and evaluating alternatives for addressing multiple purpose and multi objective water quantity and quality management challenges. Reinforced with cases studies, exercises, and media supplements throughout the text, it is ideal for upper level undergraduate and graduate courses in water resource planning and management as well as for practicing planners and engineers in the field.

Discrete-Time Markov Control Processes Onesimo Hernandez-Lerma, Jean B.

Lasserre, 2012-12-06 This book presents the first part of a planned two volume series devoted to a systematic exposition of some recent developments in the theory of discrete time Markov control processes (MCPs). Interest is mainly confined to MCPs with Borel state and control or action spaces and possibly unbounded costs and noncompact control constraint sets. MCPs are a class of stochastic control problems also known as Markov decision processes, controlled Markov processes, or stochastic dynamic programs. Sometimes, particularly when the state space is a countable set, they are also called Markov decision or controlled Markov chains. Regardless of the name used, MCPs appear in many fields, for example, engineering, economics, operations research, statistics, renewable and nonrenewable resource management, control of epidemics, etc. However, most of the literature says at least 90% is concentrated on MCPs for which a) the state space is a countable set and/or b) the costs per stage are bounded and/or c) the control constraint sets are compact. But curiously enough, the most widely used control model in engineering and economics, namely the LQ (Linear system Quadratic cost) model, satisfies none of these conditions. Moreover, when dealing with partially observable systems, a standard approach is to transform them into equivalent, completely observable systems in a larger state space, in fact a space of probability measures which is uncountable, even if the original state process is finite valued.

Handbook on Optimal Growth 1 Rose-Anne Dana, Cuong Van, Tapan Mitra, Kazuo

Nishimura, 2006-07-01 The problem of efficient or optimal allocation of resources is a fundamental concern of economic analysis. The theory of optimal economic growth can be viewed as an aspect of this central theme which emphasizes in general the issues arising in the allocation of resources over an infinite time horizon and in particular the consumption investment decision process in models in which there is no natural terminal date. This broad scope of optimal growth theory is one which has evolved over time as economists have discovered new interpretations of its central results as well as new applications of its basic methods. The purpose of this handbook is to provide surveys of some significant results of the theory of optimal growth as well as the techniques of dynamic optimization theory on which they are based. Armed with the results and methods of this theory, a researcher should be in an advantageous position to apply these versatile methods of analysis to new issues in the area of dynamic economics as well as to contribute to the further development of the mathematical techniques of optimization over time. The survey included in this volume all have as a common starting point the

seminal contribution of Frank Ramsey 1928 Risk Management of Supply and Cash Flows in Supply Chains Jian Li, Jia Chen, Shouyang Wang, 2011-09-15 Risk management has become an essential issue in supply chain management from the modeling of the decision maker's risk preference and the studies on uncertain elements such as demand supply price lead time etc to the consideration of more practical background including cash flow constraints inventory financing and delayed cash payment In this new volume the authors provide a framework to study the interaction of various factors related to risk and their influence on supply chain management The scope of areas covered includes operations management decision analysis and business administration This book focuses on several key issues of risk management in supply chains Specifically an analysis framework is presented for studying the supplier selection problem and identifying the optimal sourcing strategy in a one retailer two suppliers supply chain with random yields The optimal sourcing strategy of a retailer and the pricing strategies of two suppliers under an environment of supply disruption are investigated Besides the authors study the dynamic inventory control problems with cash flow constraints financing decisions as well as delayed cash payment In addition originating from the annual international iron ore price negotiation the authors model the bargaining process to deal with the risk of wholesale price in the game analysis context Within the three perspectives of risk management in supply chains the modeling of decision maker's risk preference has been extensively studied and many results have been obtained to guide the practice However the analysis on the other two kinds of topics is still in its infancy and needs more efforts from academia It is thus the ambition and innovation for this book to contribute on risk management in supply chains in the following ways 1 characterizing the explicit sourcing strategy i.e. single sourcing or dual sourcing to deal with supply disruption risk 2 introducing the concepts of financial risk measurement by incorporating cash flow constraints inventory financing and delayed cash payment into inventory management models and 3 providing insights for the iron ore price negotiation to help steel manufacturers handle the risk of price increase *Group Decision and Negotiation: A Multidisciplinary Perspective* Danielle Costa Morais, Liping Fang, Masahide Horita, 2020-05-12 This book constitutes the refereed proceedings of the 20th International Conference on Group Decision and Negotiation GDN 2020 which was planned to be held in Toronto ON Canada during June 7-11 2020 The conference was cancelled due to the Coronavirus pandemic Nevertheless it was decided to publish the proceedings because the review process had already been completed at the time the cancellation was decided The field of Group Decision and Negotiation focuses on decision processes with at least two participants and a common goal but conflicting individual goals Research areas of Group Decision and Negotiation include electronic negotiations experiments the role of emotions in group decision and negotiations preference elicitation and decision support for group decisions and negotiations and conflict resolution principles The 14 full papers presented in this volume were carefully reviewed and selected from 75 submissions They were organized in topical sections named Conflict Resolution Preference Modeling for Group Decision and Negotiation Intelligent Group Decision Making and Consensus
