Lam, 2012-12-06 This book is a revision of my Ph D thesis dissertation submitted to Carnegie Mellon University in 1987 It documents the research and results of the compiler technology developed for the Warp machine Warp is a systolic array built out of custom high performance processors each of which can execute up to 10 million floating point operations per second 10 MFLOPS Under the direction of H T Kung the Warp machine matured from an academic experimental prototype to a commercial product of General Electric The Warp machine demonstrated that the scalable architecture of high peiformance programmable systolic arrays represents a practical cost effective solution to the present and future computation intensive applications The success of Warp led to the follow on iWarp project a joint project with Intel to develop a single chip 20 MFLOPS processor The availability of the highly integrated iWarp processor will have a significant impact on parallel computing One of the major challenges in the development of Warp was to build an optimizing compiler for the machine First the processors in the xx A Systolic Array Optimizing Compiler array cooperate at a fine granularity of parallelism interaction between processors must be considered in the generation of code for individual processors Second the individual processors themselves derive their performance from a VLIW Very Long Instruction Word instruction set and a high degree of internal pipelining and parallelism The compiler contains optimizations pertaining to the array level of parallelism as well as optimizations for the individual VLIW processors Engineering a Compiler Keith D. dating back to a memo of Burks Goldstine and von Neumann of 1946 The so called von Neumann architecture is characterized by a se quential control flow resulting in a sequential instruction stream A program counter addresses the next instruction if the preceding instruction is not a control instruction such as e g jump branch subprogram call or return An instruction is coded in an instruction format of fixed or variable length where the opcode is followed by one or more operands that can be data addresses of data or the address of an instruction in the case of a control instruction. The opcode defines the types of operands Code and data are stored in a common storage that is linear addressed in units of memory words bytes words etc The overwhelming design criterion of the von Neumann computer was the minimization of hardware and especially of storage The most simple implementation of a von Neumann computer is characterized by a microar chitecture that defines a closely coupled control and arithmetic logic unit ALU a storage unit and an I O unit all connected by a single connection unit The instruction fetch by the control unit alternates with operand fetches and result stores for the AL U of Niklaus Wirth László Böszörményi,2000 **Languages, Compilers, and Tools for Embedded Systems** Jack Davidson, Sang Lyul Min, 2003-06-29 This volume contains the proceedings of the ACM SIGPLAN Workshop on L guages Compilers and Tools for Embedded Systems LCTES 2000 held June 18 2000 in Vancouver Canada Embedded systems have developed consid ably in the past decade and we expect this technology to become even more important in computer science and engineering in the new millennium Interest in the workshop has been con rmed by the submission of papers from all over the world There were 43 submissions representing more than 14 countries Each submitted paper was reviewed by at least three members of the program committee The expert opinions of many outside reviewers were in luable in making the selections and ensuring the high quality of the program for which we express our sincere gratitude The nal program features one invited talk twelve presentations and ve poster presentations which reject recent vances in formal systems compilers tools and hardware for embedded systems We owe a great deal of thanks to the authors reviewers and the members of the program committee for making the workshop a success Special thanks to Jim Larus the General Chair of PLDI 2000 and Julie Goetz of ACM for all their help and support Thanks should also be given to Sung Soo Lim at Seoul National University for his help in coordinating the paper submission and review process We also thank Professor Gaetano Borriello of the University of Washington for his invited talk on Chinook a hardware software co synthesis CAD tool for embedded systems Languages and Compilers for Parallel Computing Larry Carter, Jeanne Ferrante, 2003-06-29 In August 1999 the Twelfth Workshop on Languages and Compilers for P allel Computing LCPC was hosted by the Hierarchical Tiling Research group from the Computer Science and Engineering Department at the University of California San Diego UCSD The workshop is an annual international forum for leading research groups to present their current research activities and the latest results It has also been a place for researchers and practitioners to teract closely and exchange ideas about future directions Among the topics of interest to the workshop are language features code generation debugging timization communication and distributed

Bhattacharyya, Ed F. Deprettere, Rainer Leupers, Jarmo Takala, 2010-09-10 It gives me immense pleasure to introduce this timely handbook to the research velopment communities in the eld of signal processing systems SPS This is the rst of its kind and represents state of the arts coverage of research in this eld The driving force behind information technologies IT hinges critically upon the major advances in both component integration and system integration The major breakthrough for the former is undoubtedly the invention of IC in the 50 s by Jack S Kilby the Nobel Prize Laureate in Physics 2000 In an integrated circuit all components were made of the same semiconductor material Beginning with the pocket calculator in 1964 there have been many increasingly complex applications followed In fact processing gates and memory storage on a chip have since then grown at an exponential rate following Moore's Law Moore himself admitted that Moore's Law had turned out to be more accurate longer lasting and deeper in impact than he ever imagined With greater device integration various signal processing systems have been realized for many killer IT applications Further breakthroughs in computer sciences and Internet technologies have also catalyzed large scale system integration All these have led to today s IT revolution which has profound impacts on our lifestyle and overall prospect of humanity It is hard to imagine life today without mobiles or Internets The success of SPS requires a well concerted integrated approach from mul ple disciplines such as device design and application
