Smooth Nonlinear Optimization in Rn Tamás Rapcsák, 2013-12-01 Experience gained during a ten year long involvement in modelling program ming and application in nonlinear optimization helped me to arrive at the conclusion that in the interest of having successful applications and efficient software production knowing the structure of the problem to be solved is in dispensable This is the reason why I have chosen the field in question as the sphere of my research Since in applications mainly from among the nonconvex optimization models the differentiable ones proved to be the most efficient in modelling especially in solving them with computers I started to deal with the structure of smooth optimization problems The book which is a result of more than a decade of research can be equally useful for researchers and stu dents showing interest in the domain since the elementary notions necessary for understanding the book constitute a part of the university curriculum I in tended dealing with the key guestions of optimization theory which endeavour obviously cannot bear all the marks of completeness What I consider the most crucial point is the uniform differential geometric treatment of various questions which provides the reader with opportunities for learning the structure in the wide range within optimization problems I am grateful to my family for affording me tranquil productive circumstances I express my gratitude to F **Introduction to Optimization on Smooth Manifolds** Nicolas Boumal, 2023-03-16 An invitation to optimization with Riemannian geometry for applied mathematics computer science and engineering students and researchers Functions Jonathan M. Borwein, Jon D. Vanderwerff, 2010-01-14 The product of a collaboration of over 15 years this volume is unique because it focuses on convex functions themselves rather than on convex analysis The authors explore the various classes and their characteristics treating convex functions in both Euclidean and Banach spaces **Vector Variational Inequalities and Vector Equilibria** F. Giannessi, 2013-12-01 The book deals with the mathematical theory of vector variational inequalities with special reference to equilibrium problems Such models have been introduced recently to study new problems from mechanics structural engineering networks and industrial management and to revisit old ones The common feature of these problems is that given by the presence of concurrent objectives and by the difficulty of identifying a global functional like energy to be extremized The vector variational inequalities have the advantage of both the variational ones and vector optimization which are found as special cases Among several applications the equilibrium flows on a network receive special attention Audience The book is addressed to academic researchers as well as industrial ones in the fields of mathematics engineering mathematical programming control theory operations research computer science and economics

Handbook of Variational Methods for Nonlinear Geometric Data Philipp Grohs, Martin Holler, Andreas Weinmann, 2020-04-03 This book covers different current research directions in the context of variational methods for non linear geometric data Each chapter is authored by leading experts in the respective discipline and provides an introduction an overview and a description of the current state of the art Non linear geometric data arises in various applications in

science and engineering Examples of nonlinear data spaces are diverse and include for instance nonlinear spaces of matrices spaces of curves shapes as well as manifolds of probability measures Applications can be found in biology medicine product engineering geography and computer vision for instance Variational methods on the other hand have evolved to being amongst the most powerful tools for applied mathematics They involve techniques from various branches of mathematics such as statistics modeling optimization numerical mathematics and analysis The vast majority of research on variational methods however is focused on data in linear spaces Variational methods for non linear data is currently an emerging research topic As a result and since such methods involve various branches of mathematics there is a plethora of different recent approaches dealing with different aspects of variational methods for nonlinear geometric data Research results are rather scattered and appear in journals of different mathematical communities. The main purpose of the book is to account for that by providing for the first time a comprehensive collection of different research directions and existing approaches in this context It is organized in a way that leading researchers from the different fields provide an introductory overview of recent research directions in their respective discipline As such the book is a unique reference work for both newcomers in the field of variational methods for non linear geometric data as well as for established experts that aim at to exploit new research directions or collaborations Chapter 9 of this book is available open access under a CC BY 4 0 license at link Combinatorial and Global Optimization Panos M. M. Gould, Philippe L. Toint, 2022-07-06 A popular way to assess the effort needed to solve a problem is to count how many evaluations of the problem functions and their derivatives are required In many cases this is often the dominating computational cost Given an optimization problem satisfying reasonable assumptions and given access to problem function values and derivatives of various degrees how many evaluations might be required to approximately solve the problem Evaluation Complexity of Algorithms for Nonconvex Optimization Theory Computation and Perspectives addresses this question for nonconvex optimization problems those that may have local minimizers and appear most often in practice This is the first book on complexity to cover topics such as composite and constrained optimization derivative free optimization subproblem solution and optimal lower and sharpness bounds for nonconvex problems It is also the first to address the disadvantages of traditional optimality measures and propose useful surrogates leading to algorithms that compute approximate high order critical points and to compare traditional and new methods highlighting the advantages of the latter from a complexity point of view This is the go to book for those interested in solving nonconvex optimization problems It is suitable for advanced undergraduate and graduate students in courses on advanced numerical analysis data science numerical optimization and approximation theory **Optimization and Applications** Yury Evtushenko, Milojica Jaćimović, Michael Khachay, Yury Kochetov, Vlasta Malkova, Mikhail Posypkin, 2019-01-09 This book constitutes the refereed proceedings of the 9th International Conference on Optimization and Applications OPTIMA 2018 held in Petrovac Montenegro in October 2018 The 35 revised full papers and the one short paper presented were carefully reviewed and

The book includes an extensive bibliography and a rich index thus allowing for quick orientation among the vast collection of literature on the mathematical theory of nonlinear phenomena described by elliptic partial differential equations **Maximum-Entropy Sampling Marcia** Fampa, Jon Lee, 2022-10-29 This monograph presents a comprehensive treatment of the maximum entropy sampling problem MESP which is a fascinating topic at the intersection of mathematical optimization and data science The text situates MESP in information theory as the algorithmic problem of calculating a sub vector of pre specificed size from a multivariate Gaussian random vector so as to maximize Shannon's differential entropy. The text collects and expands on state of the art algorithms for MESP and addresses its application in the field of environmental monitoring While MESP is a central optimization problem in the theory of statistical designs particularly in the area of spatial monitoring this book largely focuses on the unique challenges of its algorithmic side From the perspective of mathematical optimization methodology MESP is rather unique a 0.1 nonlinear program having a nonseparable objective function and the algorithmic techniques employed are highly non standard In particular successful techniques come from several disparate areas within the field of mathematical optimization for example convex optimization and duality semidefinite programming Lagrangian relaxation dynamic programming approximation algorithms 0.1 optimization e.g. branch and bound extended formulation and many aspects of matrix theory The book is mainly aimed at graduate students and researchers in mathematical optimization and

Leine, Nathan fascinating domains van de Wouw, 2007-12-29 Stability of motion is a central theme in the dynamics of mechanical systems While the stability theory for systems with bilateral constraints is a well established field this monograph represents a systematic study of mechanical systems with unilateral constraints such as unilateral contact impact and friction Such unilateral constraints give rise to non smooth dynamical models for which stability theory is developed in this work. The book starts with the treatise of the mathematical background on non smooth analysis measure and integration theory and an introduction to the field of non smooth dynamical systems The unilateral constraints are modelled in the framework of set valued force laws developed in the field of non smooth mechanics The embedding of these constitutive models in the dynamics of mechanical systems gives rises to dynamical models with impulsive phenomena This book uses the mathematical framework of measure differential inclusions to formalise such models The book proceeds with the presentation of stability results for measure differential inclusions These stability results are then applied to nonlinear mechanical systems with unilateral constraints The book closes with the study of the convergence property for a class of measure differential inclusions a stability property for systems with time varying inputs which is shown to be highly instrumental in the context of the control of mechanical systems with unilateral constraints While the book presents a profound stability theory for mechanical systems with unilateral constraints it also has a tutorial value on the modelling of such systems in the framework of measure differential inclusions The work will be of interest to engineers scientists and students working in the field of non smooth mechanics and
