

A movie poster for 'Into the Deep'. The background is a deep blue underwater scene. In the upper right, a diver in a blue wetsuit and mask swims away from the viewer, holding a flashlight. In the lower left, a large shark is shown from the side, swimming towards the right. The title 'INTO THE DEEP' is prominently displayed in the center-right. At the bottom, it says 'COMING SOON' followed by the names of the cast members.

The Deep:

The Deep Peter Benchley, 1977 **Natural Capital and Exploitation of the Deep Ocean** Maria Baker, Eva Ramirez-Llodra, Paul Tyler, 2020-08-28 The deep ocean is by far the planet's largest biome and holds a wealth of potential natural assets. Human exploitation of the deep ocean is rapidly increasing whilst becoming more visible to many through the popular media, particularly film and television. The scientific literature of deep sea exploitation and its effects has also rapidly expanded as a direct function of this increased national and global interest in exploitation of deep sea resources, both biological (e.g. fisheries, genetic resources) and non biological (e.g. minerals, oil, gas, methane hydrate). At the same time there is a growing interest in deep sea contamination, including plastics, with many such studies featured in high profile scientific journals and covered by global media outlets. However, there is currently no comprehensive integration of this information in any form, and these topics are only superficially covered in classic textbooks on deep sea biology. This concise and accessible work provides an understanding of the relationships between biodiversity and ecosystem functioning both at the seafloor and in the water column, and how these might be affected as a result of human interaction, exploitation, and ultimately environmental change. It follows a logical progression from geological and physical processes, ecology, biology, and biogeography to exploitation, management, and conservation. **Natural Capital and Exploitation of the Deep Ocean** is aimed at marine biologists and ecologists, oceanographers, fisheries scientists and managers, fish biologists, environmental scientists, and conservation biologists. It will also be of relevance and use to a multi-disciplinary audience of fish and wildlife agencies, NGOs, and government departments involved in deep sea conservation and management.

The Deep Mixing Method Masaki Kitazume, Masaaki Terashi, 2013-02-21 The Deep Mixing Method (DMM), a deep in situ soil stabilization technique using cement and/or lime as a stabilizing agent, was developed in Japan and in the Nordic countries independently in the 1970s. Numerous research efforts have been made in these areas, investigating properties of treated soil, behavior of DMM-improved ground under static and dynamic conditions, design methods, and execution techniques. Due to its wide applicability and high improvement effect, the method has become increasingly popular in many countries in Europe, Asia, and in the USA. In the past three to four decades, traditional mechanical mixing has been improved to meet changing needs. New types of the technology have also been developed in the last 10 years (e.g. the high pressure injection mixing method and the method that combines mechanical mixing and high pressure injection mixing technologies). The design procedures for the DM methods were standardized across several organizations in Japan and revised several times. Information on these rapid developments will benefit those researchers and practitioners who are involved in ground improvement throughout the world. The book presents the state of the art in Deep Mixing methods and covers recent technologies, research activities, and know-how in machinery design, construction technology, and quality control and assurance. **The Deep Mixing Method** is a useful reference tool for engineers and researchers involved in DMM technology everywhere, regardless of local soil conditions and variety in

Visual Domain Adaptation in the Deep Learning Era Gabriela Csurka,Timothy M. Hospedales,Mathieu Salzmann,Tatiana Tommasi,2022-06-06 Solving problems with deep neural networks typically relies on massive amounts of labeled training data to achieve high performance While in many situations huge volumes of unlabeled data can be and often are generated and available the cost of acquiring data labels remains high Transfer learning TL and in particular domain adaptation DA has emerged as an effective solution to overcome the burden of annotation exploiting the unlabeled data available from the target domain together with labeled data or pre trained models from similar yet different source domains The aim of this book is to provide an overview of such DA TL methods applied to computer vision a field whose popularity has increased significantly in the last few years We set the stage by revisiting the theoretical background and some of the historical shallow

methods before discussing and comparing different domain adaptation strategies that exploit deep architectures for visual recognition We introduce the space of self training based methods that draw inspiration from the related fields of deep semi supervised and self supervised learning in solving the deep domain adaptation Going beyond the classic domain adaptation problem we then explore the rich space of problem settings that arise when applying domain adaptation in practice such as partial or open set DA where source and target data categories do not fully overlap continuous DA where the target data comes as a stream and so on We next consider the least restrictive setting of domain generalization DG as an extreme case where neither labeled nor unlabeled target data are available during training Finally we close by considering the emerging area of learning to learn and how it can be applied to further improve existing approaches to cross domain learning problems such as DA and DG
