

Geographic mosaic theory

Interactions coevolve as constantly changing geographic mosaics

Coevolution is prominent in some areas (coevolutionary hotspots) but not others (coevolutionary cold spots) that the outcome of an interaction can vary between areas and that gene flow can affect the outcome of interactions

Hypothetical example of a Geographic Mosaic of Coevolution between two species.
The coloured circles stand for biological communities; the arrows within the circles show interactions within local communities and represent selection on one or both (or none) species (truly reciprocal selection = hotspot). Selection among communities is generated from disparities in biotic or abiotic habitat quality. The arrows between the communities indicate gene flow (thicker arrows = more gene flow).

Scott P. Carroll, Charles W. Fox

The Geographic Mosaic Of Coevolution Interspecific Interactions:

The Geographic Mosaic of Coevolution John N. Thompson, 2005-06-15 Coevolution reciprocal evolutionary change in interacting species driven by natural selection is one of the most important ecological and genetic processes organizing the earth's biodiversity most plants and animals require coevolved interactions with other species to survive and reproduce The Geographic Mosaic of Coevolution analyzes how the biology of species provides the raw material for long term coevolution evaluates how local coadaptation forms the basic module of coevolutionary change and explores how the coevolutionary process reshapes locally coevolving interactions across the earth's constantly changing landscapes Picking up where his influential The Coevolutionary Process left off John N Thompson synthesizes the state of a rapidly developing science that integrates approaches from evolutionary ecology population genetics phylogeography systematics evolutionary biochemistry and physiology and molecular biology Using models data and hypotheses to develop a complete conceptual framework Thompson also draws on examples from a wide range of taxa and environments illustrating the expanding breadth and depth of research in coevolutionary biology

The Coevolutionary Process John N. Thompson, 2009-04-24 Traditional ecological approaches to species evolution have frequently studied too few species relatively small areas and relatively short time spans In The Coevolutionary Process John N Thompson advances a new conceptual approach to the evolution of species interactions the geographic mosaic theory of coevolution Thompson demonstrates how an integrated study of life histories genetics and the geographic structure of populations yields a broader understanding of coevolution or the development of reciprocal adaptations and specializations in interdependent species Using examples of species interactions from an enormous range of taxa Thompson examines how and when extreme specialization evolves in interdependent species and how geographic differences in specialization adaptation and the outcomes of interactions shape coevolution Through the geographic mosaic theory Thompson bridges the gap between the study of specialization and coevolution in local communities and the study of broader patterns seen in comparisons of the phylogenies of interacting species

Conservation Biology Scott P. Carroll, Charles W. Fox, 2008-09-15 The main goal of this book is to encourage and formalize the infusion of evolutionary thinking into mainstream conservation biology It reviews the evolutionary foundations of conservation issues and unifies conceptual and empirical advances in evolutionary conservation biology The book can be used either as a primary textbook or as a supplementary reading in an advanced undergraduate or graduate level course likely to be called Conservation Biology or in some cases Evolutionary Ecology The focus of chapters is on current concepts in evolution as they pertain to conservation and the empirical study of these concepts The balanced treatment avoids exhaustive reviews and overlapping duplication among the chapters Little background in genetics is assumed of the reader

Encyclopedia of Ecology Brian D. Fath, 2018-08-23 Encyclopedia of Ecology Second Edition Four Volume Set continues the acclaimed work of the previous edition published in 2008 It covers all scales of biological organization from organisms to

populations to communities and ecosystems Laboratory field simulation modelling and theoretical approaches are presented to show how living systems sustain structure and function in space and time New areas of focus include micro and macro scales molecular and genetic ecology and global ecology e g climate change earth transformations ecosystem services and the food water energy nexus are included In addition new international experts in ecology contribute on a variety of topics Offers the most broad ranging and comprehensive resource available in the field of ecology Provides foundational content and suggests further reading Incorporates the expertise of over 500 outstanding investigators in the field of ecology including top young scientists with both research and teaching experience Includes multimedia resources such as an Interactive Map Viewer and links to a CSDMS Community Surface Dynamics Modeling System an open source platform for modelers to share and link models dealing with earth system processes

Trait-Mediated Indirect Interactions Takayuki Ohgushi, Oswald Schmitz, Robert D. Holt, 2012-12-06 There is increasing evidence that the structure and functioning of ecological communities and ecosystems are strongly influenced by flexible traits of individuals within species A deep understanding of how trait flexibility alters direct and indirect species interactions is crucial for addressing key issues in basic and applied ecology This book provides an integrated perspective on the ecological and evolutionary consequences of interactions mediated by flexible species traits across a wide range of systems It is the first volume synthesizing the rapidly expanding research field of trait mediated indirect effects and highlights how the conceptual framework of these effects can aid the understanding of evolutionary processes population dynamics community structure and stability and ecosystem function It not only brings out the importance of this emerging field for basic ecological questions but also explores the implications of trait mediated interactions for the conservation of biodiversity and the response of ecosystems to anthropogenic environmental changes

Grant, B. Rosemary Grant, 2021-07-13 Evolutionary biology has witnessed breathtaking advances in recent years Some of its most exciting insights have come from the crossover of disciplines as varied as paleontology molecular biology ecology and genetics This book brings together many of today's pioneers in evolutionary biology to describe the latest advances and explain why a cross disciplinary and integrated approach to research questions is so essential Contributors discuss the origins of biological diversity mechanisms of evolutionary change at the molecular and developmental levels morphology and behavior and the ecology of adaptive radiations and speciation They highlight the mutual dependence of organisms and their environments and reveal the different strategies today's researchers are using in the field and laboratory to explore this interdependence Peter and Rosemary Grant renowned for their influential work on Darwin's finches in the Galapagos provide concise introductions to each section and identify the key questions future research needs to address In addition to the editors the contributors are Myra Awoodey Christopher N Balakrishnan Rowan D H Barrett May R Berenbaum Paul M Brakefield Philip J Currie Scott V Edwards Douglas J Emlen Joshua B Gross Hopi E Hoekstra Richard Hudson David Jablonski David T Johnston Mathieu Joron David Kingsley Andrew H Knoll Mimi A R Koehl June Y Lee Jonathan B Losos Isabel Santos Magalhaes Albert B Phillimore Trevor Price Dolph Schluter Ole Seehausen Clifford J Tabin John N Thompson and David B Wake *Interaction and Coevolution* John N. Thompson, 2022-12-22 It is not only the species that change evolutionarily through interactions the interactions themselves also change Thus states John N Thompson in the foreword to *Interaction and Coevolution* the first title in his series of books exploring the relentless nature of evolution and the processes that shape the web of life Originally published in 1982 more as an idea piece an early attempt to synthesize then academically distinct but logically linked strands of ecological thought and to suggest avenues for further research than as a data driven monograph *Interaction and Coevolution* would go on to be considered a landmark study that pointed to the

beginning of a new discipline Through chapters on antagonism mutualism and the effects of these interactions on populations speciation and community structure Thompson seeks to explain not only how interactions differ in the selection pressures they exert on species but also when interactions are most likely to lead to coevolution In this era of climate change and swiftly transforming environments the ideas Thompson puts forward in Interaction and Coevolution are more relevant than ever before
