Long-Term Integration of Renewable Energy Sources into the European Energy System The LTI-Research Group, 2012-12-06 A sustainable European energy system mitigating climate change and solving a number of other key environmental problems will require massive reliance on renewable energy sources combined with a sharp increase in energy productivity Considering that most of the technologies necessary for such a development are already available today s most important questions are How can these technologies be integrated into the European energy system What are the costs and benefits of such a strategy What are the major bottlenecks and obstacles to such a development What measures are necessary to support this development In the book a sustainable scenario and a fair market scenario are developed as a means to demonstrate that concepts for a sustainable future European energy supply are feasible **Ethics in Danish**

Energy Policy Finn Arler, Mogens Rüdiger, Karl Sperling, Kristian Høyer Toft, Bo Poulsen, 2020-03-12 This book deepens our understanding of ethical drivers in energy policy and contributes to future decision making on transitions towards a sustainable energy system During the latest fifty years Western energy politics have been faced with a series of ethical challenges including rapid growth oil crises security of supply nuclear power and climate change Combining philosophical historical and planning approaches into one narrative these dilemmas are explored using Denmark as the key case study Drawing on contributions from several experts in the field the ethics of energy is investigated from multiple perspectives at the individual corporate local and national levels focusing on concrete decisions where different ethical considerations are weighted against each other This comprehensive approach helps to gain a deeper understanding of the energy sector s history and gives important input to its future layout Drawing comparisons with European and global examples this book will be of great interest to students and scholars of energy politics and policy environmental ethics climate change and sustainability transitions **Renewable Energy** Bent Sørensen, 2004-07-16 Publisher Description **Transitions To**

Alternative Energy Systems Thomas Baumgartner, 2019-03-22 The industrial world was built to run on cheap oil and now the cheap oil has run out For a while longer the West will depend for its energy upon expensive oil much of it obtained from sources that are geographically remote or politically unstable so in the near future the world must shift from oil to other sources of energy TRANSITIONS TO ALTERNATIVE ENERGY SYSTEMS explores how such change can best be encouraged The governments of the world then do not have the option of piously washing their hands of the energy crisis They must be involved they must pursue wise policies and they must prove far more effective in the future than they have in the past Through its careful analysis of past programs to promote renewable resource development Tom Baumgartner s new book provides the public sector with precisely the kind of guidance it needs **Successful Public Policy in the Nordic**

Life-cycle Analysis of Energy Systems Bent Sørensen,2011 Life cycle assessment of new energy

solutions plays an important role in discussions about global warming mitigation options and the evaluation of concrete energy production and conversion installations This book starts by describing the methodology of life cycle analysis and life cycle assessment of new energy solutions It then goes on to cover in detail a range of applications to individual energy installations national supply systems and to the global energy system in a climate impact context Coverage is not limited to issues related to commercial uses by consultants according to ISO norms It also emphasizes life cycle studies as an open ended scientific discipline embracing economic issues of cost employment equity foreign trade balances ecological sustainability and a range of geo political and social issues A wealth of applications are described and a discussion on the results obtained in each study is included Example areas are fossil and nuclear power plants renewable energy systems and systems based on hydrogen or batteries as energy carriers The analysis is continued to the end users of energy where energy use in transportation industry and home are scrutinized for their life cycle impacts Biofuel production and the combustion of firewood in home fireplaces and stoves are amongst the issues discussed A central theme of the book is global warming The impacts of greenhouse gas emissions are meticulously mapped at a depth far beyond that of the IPCC reports A novel and surprising finding is that more lives will be saved than lost as a direct consequence of a warmer climate After a 2oC increase in temperature the reduction in death rates in areas with cold winters would outweigh the increase in the death rates in hot climates However this is only one of several impacts from greenhouse gases and the remaining ones are still overwhelmingly negative The fact that some population groups may benefit from higher temperatures notably the ones most responsible for greenhouse gas emissions whilst others who did not contribute much to the problem suffer is one of the main points of the book The book is suitable as a university textbook and as a reference source for engineers managers and public bodies responsible for planning and licensing

Low Carbon Energy Transitions Kathleen M. Araújo, 2017 Examines four long term cases of nations shifting to low carbon energy sources from dependence on fossil fuels in order to discuss better ways for a nation to make such a transition

Hydrogen and Fuel Cells Bent Sorensen, Giuseppe Spazzafumo, 2018-02-10 In a multidisciplinary field such as energy Hydrogen and Fuel Cells stands out by covering the entire width of hydrogen production and usage technologies giving detailed descriptions of not just one but the range of very different fuel cells that have been developed or are under development In one volume respected experts Bent Sorensen and Giuseppe Spazzafumo provide all the basic scientific theory underlying hydrogen and fuel cell technologies but at the same time present applications and sustainable integration into society in a way accessible to a broad range of people working in this field whether in technical economic or management roles The third edition reflects both recently emerged technologies and the market penetration of the most promising technologies and it gives an appraisal of how far fuel cell technology may go in the future considering current challenges and economic trends This new edition has updated and expanded content on hydrogen storage and transmission molten carbonate fuel cells PEM fuel cells solid oxide fuel cells biofuel cells including microbial fuel

cells applications in transportation and power plants future scenarios and life cycle assessment It is ideal for researchers and professionals in the field of energy and renewable energy in particular both in academia and industry It is also useful to lecturers and graduate students in engineering physics and environmental sciences as well as professionals involved in energy or environmental regulation and policy Gain thorough understanding of the science and applications of hydrogen and a range of different fuel cells including economic and social aspects of the field Updated sections include hydrogen storage and transportation biofuel cells PEM and solid oxide fuel cells applications in transportation and large scale power generation and life cycle assessment
