

Taste & Smell

Taste & smell

Most of our special senses are chemoreception systems: gustation (taste) and olfaction (smell). The degree to which we can respond to taste or olfaction, thereby using smell and taste to guide our behavior, depends on the number of receptors that respond to molecules dissolved in fluid (taste) and in the air (smell). The sense of taste is less discriminatory than the sense of smell, and there is an overlap between taste receptors. The sense of smell is highly discriminatory, with several types of olfactory receptors, each responding to particular odors. Taste and olfaction are related to smell, vision and hearing, important with the sense of touch, but taste is particularly affected by the sense of smell.

Concentrations

Taste receptors vary depending on the concentration of substances in a given solution or solid. For low concentrations, taste and smell receptors may taste glucose.

Gustation

Gustation, the sense of taste, gives us information about the food and drink that we consume. Taste buds on the primary gustatory organ, the tongue, contain chemoreception called gustatory cells. These taste buds have four types of receptors: sweet, salty and fatty (A/Bs), bitter (T2Rs), and sour (P/Ks). These buds are located on the tongue, in the oral cavity, and in the throat.

The taste bud

Each taste bud contains a single gustatory cell. The taste hairs (microvilli) extend from the apical end of the gustatory cell, where the receptors are located. The taste hairs are replaced by new cells generated from basal cells at the base of the taste bud.

Olfaction

The sense of smell is called olfaction, or the detection of odors. Olfaction depends on specialized chemical receptors, or chemoreceptors, located within the olfactory epithelium. These receptors are designed to respond to small amounts of an odorant, a molecule that can be smelled. The brain integrates the input from several different receptors to identify a particular odor. Humans can detect about 10,000 odors.

As air flows through the nose, the odors across the nasal cavity pass through the olfactory epithelium, bringing odorous molecules into contact with the olfactory neurons. Binding increases the ability to detect odors by increasing the volume of air inhaled, which can increase the number of receptors.

Olfactory receptors

Olfactory receptors

Olfaction depends on the olfactory epithelium, which is located in the nasal cavity. The olfactory epithelium is a specialized tissue that contains the olfactory neurons. These neurons are designed to respond to small amounts of an odorant, a molecule that can be smelled. The brain integrates the input from several different receptors to identify a particular odor. Humans can detect about 10,000 odors.

Compound sweet and salty tastes, we are left with more receptors to taste compounds, and about 1,000 taste buds are located on the tongue. The taste buds are located on the tongue, in the oral cavity, and in the throat. These buds are located on the tongue, in the oral cavity, and in the throat.

The synapse

Neurons communicate with other cells at a synapse, the site of a nerve impulse transmission. The space between the presynaptic, or sending, neuron and the postsynaptic, or receiving, cell is called the synaptic cleft. An impulse enters at the tip of the axon, the terminal button, where "messenger" molecules called neurotransmitters. These highly specialized chemicals carry nerve impulses from the presynaptic cell to the postsynaptic cell. The impulse enters the cell, where it is released into the synaptic cleft, where it is released into the synaptic cleft.

Taste and Smell Doug Kincaid, Peter Sephton Coles, 1983 Introduces the senses of taste and smell and explains how some things are good to taste while others are not and how smells can tell us about things and warn us of danger *Head and Neck* Enrico Marani, Ciska Heida, 2018-11-02 This book offers a critical review of the head and neck from an anatomical physiological and clinical perspective It begins by providing essential anatomical and physiological information then discusses historical and current views on specific aspects in subsequent chapters For example the anatomy of the skull cap or cranial vault provided in the first chapter is discussed in the context of malformation and identity as well as the development of the bony skull in the following chapters These chapters provide stepping stones to guide readers through the book There are new fields of research and technological developments in which Anatomy and Physiology lose track of progress One of the examples discussed is the automated face recognition In some respects e.g. when it comes to cancers and

malformations our understanding of the head and neck and the resulting therapeutic outcomes have been extremely disappointing In others such as injuries following car accidents there have been significant advances in our understanding of head and neck dysfunctions and their treatment Therefore head movements also during sleep and head and neck reflexes are discussed The book makes unequivocal distinctions between correct and incorrect assumptions and provides a critical review of alternative clinical methods for head and neck dysfunctions such as physiotherapy and lymphatic drainage for cancers Moreover it discusses the consequences of various therapeutic measures for physiological and biomechanical conditions as well as puberty and aging Lastly it addresses important biomedical engineering developments for hearing e g cochlear implants and for applying vestibular cerebellar effects for vision
