

Reception of sound

In mammals, sound waves are collected by the external, cartilaginous part of the ear, called the **pinna**. Then they travel through the auditory canal and cause vibration of the thin diaphragm called the **tympanum** (ear drum), the innermost part of the outer ear.

Interior to the tympanum is the middle ear, which holds three small bones (**ossicles**) that transfer energy from the moving tympanum to the inner ear: the **malleus** (hammer), **incus** (anvil), and **stapes** (stirrup). The ossicles are unique to mammals, and they are homologous to bones in a fish mouth: the bones that support gills in fish are thought to be adapted for use in the vertebrate ear over evolutionary time.
