actuated NEM relays are devices where the operation is based on the deformation of a flexible beam under the influence of electrostatic force in order to create a conducting path between two electrodes This work studies the fabrication process development of sidewall coated laterally actuated NEM relays The developed process enables decoupling of the mechanical and electrical properties of the relay allowing independent optimization of each property and paving the path for creating a back end of line BEOL compatible process Furthermore a major failure mechanism of NEM relays is beam to gate shorting after actuation To ameliorate this problem new designs with improved mechanical properties were simulated and tested These designs utilize a stiff electrode and a compliant beam to eliminate undesired beam deformation near the gate electrode These results in addition to variation studies stress outcomes and basic logic functionality of the NEM relays are shown
