

minor points. Dr Davison's section is concluded by three appendices, containing invaluable records of all case summaries and histories in the first two, with some of the pedigrees in the third.

The second part (21 pages) of the monograph is an aetiological investigation by Drs Swift, Benson, and Studdy of those patients hospitalized in Leybourne Grange Hospital who have an IQ of 50 or less, and at least one sib with an IQ of 60 or less. They found 66 such patients from 30 families and divided them into diagnostic groups of known aetiology, those with similar physical, but no biochemical, abnormalities among the affected sibs, those with no physical or biochemical abnormalities and a group of four families, in each of which a new biochemical error had been found (both the affected sibs in these four families were excreting excessive amounts of tyrosin, beta-alanin, 1-methylhistidin, and hydroxylysine, respectively). Column chromatography was employed in the biochemical investigations and the advantage of this technique is discussed. Case histories, listing physical and other abnormalities, are given, thus providing a valuable source of comparison for other workers in the field. The four new amino-acidurias provide scope for the study of treatment and prevention.

This small monograph should be carefully studied by all workers in the field of genetics and mental subnormality and an example taken from the methods and techniques used.

Basic Immunogenetics. By H. Hugh Fudenberg, J. R. L. Pink, Daniel P. Sides, and An-Chuan Wang. (Pp. vii+214; figures+tables. £2.20.) London: Oxford University Press. 1973.

Immunogenetics is a fundamentally important subject for at least two reasons. Firstly, immunology although in a state of near transcendental euphoria, is undoubtedly concerned with some of the most important processes in biology. In addition to resisting the incursions of pathogenic micro-organisms, important roles are claimed in differentiation, in fetal development and in oncology. Secondly, the combination of immunochemistry and formal genetics has already yielded an astonishing variety of information about eukaryotic gene action. Autosomal allelic exclusion and the demonstration that the 'one gene, one polypeptide' rule did not apply in immunoglobulin synthesis are good examples.

The term immunogenetics has been used to include the study of any genetic polymorphism providing immunological methods were used. However, one can distinguish within this definition a much more homogeneous area involving the genetics of immunity, that is the genetics of the immune response and of the structure of immunoglobulins irrespective of whether immunological techniques are used in their elucidation. Professor Fudenberg and his colleagues have produced a remarkable review of a field which incidentally has been greatly enhanced by their own activities. They have

properly concentrated on the genetics of immunity. The book begins with a gentle introduction in the form of a wide ranging essay. Chapter 2 deals with immunoglobulin structure and evolution and provides an adequate background for a remarkably comprehensible discussion of the genetics of immunoglobulin molecules covered in Chapter 3 and of antibody variability covered in Chapter 4. In Chapter 5 the genetics of histocompatibility, a brief review of T and B cells and their interaction, antigen receptors on lymphoid cells, immune deficiency states in man and animals, autoimmunity and lymphoid neoplasias, and finally the genetic control of specific immune response are reviewed in only 27 pages. In Chapter 6 the authors consider human blood groups and to some extent depart from the narrower definition of immunogenetics by including systems which, although they may have been detected by immunological (usually serological) techniques, presumably have, with one or two exceptions, little to do *in vivo* with the immune response. Finally, in three appendices, blood group terminology, standard abbreviations for immunological terms (immunology must be 'Top of the Pops' so far as jargon goes) and a list of methods for detecting antibody (with an indication of sensitivity) are given.

This book can be highly recommended not only 'for the graduate and medical student with a fair knowledge of biochemistry and genetics' as the authors modestly put it, but also for more advanced workers, including physicians, who want an up-to-date, brief, and understandable overview of this rapidly advancing and still slightly anarchic field.

Birth Defects: Original Article Series, 8, Pt. 15, No. 5. Fourth Conference on The Clinical Delineation of Birth Defects, 'The Cardiovascular System'. (Pp. 325; figures+tables. £13.00; US \$29.00.) Baltimore: Williams and Wilkins; Edinburgh: Churchill Livingstone, 1972.

The value of this series of publications in enhancing medical communication in the birth defects field has been proven many times over. The present volume should be stimulating for all concerned with the diagnosis, treatment, and counselling of congenital heart disorders.

Several articles are of outstanding interest. Dr van Praagh's segmental approach to the diagnosis of congenital heart disease does indeed simplify the seemingly unlimited types of cardiac malformation. Dr Mitchell writes interestingly of her large prospective study of over 50,000 pregnant women with regard to risk factors in the mother and cardiovascular malformations in the infant. Mothers with congenital heart disease themselves have the greatest risk of producing a baby with congenital heart disease, mothers with diabetes have the second highest risk and their babies are apt to have defects of the great vessels, while mothers producing babies with transposition of the great vessels often have an unusual history of oestrogen deficiency. Increased maternal age also

Mahler, 2018-06-12 The biological birth of the human infant and the psychological birth of the individual are not coincident in time The former is a dramatic observable and well circumscribed event the latter a slowly unfolding intra psychic process Thus begins this highly acclaimed book in which the author and her collaborators break new ground in developmental psychology and present the first complete theoretical statement of the author's observations on the normal separation individuation process Separation and individuation are presented in this major work as two complementary developments Separation is described as the child's emergence from a symbiotic fusion with the mother while individuation consists of those achievements making the child's assumption of his own individual characteristics Each of the sub phases of separation individuation is described in detail supported by a wealth of clinical observations which trace the tasks confronting the infant and his mother as he progresses towards achieving his own individuality **One Child** John Apley, Christopher Ounsted, 1982-04-22 The Cartesian split of human creatures into psyche and soma has had a profoundly bad influence on the medical care of children In fact the concept of psychosomatic disease as a separate entirely false one there being no illness that does not in some way affect behaviour and no behaviour which is not in some way mediated by physiological factors However the subtleties of our understanding of child illness have gone much further than simply unmasking this false dichotomy This book will now unveil the parts played by other features of the broader environment the family stress socioeconomic factors and other predicaments including that of loving and being loved To understand the child within these wider terms the professionals involved in helping the child and the parents must in some way be given a new perspective a broader view One Child provides this perspective stepping outside conventional presentations into the more exciting possibilities of reassessing the influences and roles of the disease itself and the environment in which it arises This represents challenge and will inevitably cause controversy which should itself push the perspectives further **Child and Family Services Act, 1975** United States. Handbook of Clinical Nursing Research Ada Sue Hinshaw, Suzanne L. Feetham, Joan Shaver, 1999-06-18 This ambitious and long-awaited volume brings together foremost nursing scholars, researchers, and educators to review and critique the state of research across areas most relevant to clinical practice. The contributorship appears as a veritable who's who of nursing research, and the contents comprise primary areas in the vanguard of nursing science. In the first section, the authors explore theoretical issues, the variety of philosophical approaches to scientific inquiry in nursing, factors shaping nursing research, and the relationship of the philosophical perspectives to research methodologies. In later sections, the scientists review and analyze the state of nursing science in relation to community health, practice strategies, family care, health promotion, biobehavioral investigations, women's health, gerontologic nursing, and health system perspectives and outcomes. For physiological as well as psychological research, the most relevant theories driving the research are presented along with the review of multiple diverse instruments and measurement issues.
