A Simulation Study of Emergency Lunar Escape to Orbit Using Several Simplified Manual Guidance and Control Techniques David B. Middleton, 1971 A fixed base piloted simulator investigation has been made of the feasibility of using any of several manual guidance and control techniques for emergency lunar escape to orbit with very simplified lightweight vehicle systems The escape to orbit vehicles accommodate two men but one man performs all of the guidance and control functions Three basic attitude control modes and four manually executed trajectory guidance schemes were used successfully during approximately 125 simulated flights under a variety of conditions These conditions included thrust misalignment uneven propellant drain and a vehicle moment of inertia range of 250 to 12 000

slugs per square foot Two types of results are presented orbit characteristics and pilot ratings of vehicle handling qualities
