Software Engineering - Assignment 3: Component & User Interface Design

If you have a Study.com College Accelerator membership and are seeking college credit for this course, you must submit an assignment and pass the proctored final exam. You must submit your assignment before registering for the final. Below you will find prompts and instructions for submitting your assignment.

About this Assignment

In this course, you have learned how to create class-based component design.

In this assignment, you will develop a complete class-based design for an in-home smart thermostat that controls heating, air conditioning, and a fan.

Upon completion of this project, you will be able to:

- Define class-based component design
- Develop a data flow diagram, state chart, activity diagram, and interface descriptions
- Design a user interface
- Develop a testing plan
- Justify the design for the user interface and the testing plan.

Scenario

You are the IT manager of a company that makes in-home smart thermostats. Before you develop any code or build any product, you will need to create a system design that can be reviewed by your IT departments and key users.

This requires you to establish a design that is both functional and easy to use. You have decided to use a **class-based** design for the product, and so all subsequent design decisions flow from this. After developing the class-based design, you will establish the technical flow diagrams (data flow, state chart, etc.). These should be clear and understandable to the IT staff.

Once the flowcharts are constructed, you can continue with a user interface design, always thinking from the users' point of view. You may think you know what a user wants, but many companies also bring in end-users to provide feedback on your design.

Finally, you'll need to justify your design and decisions to upper management before you can

Merrow,2022-11-24 Major Projects are Delayed by Months or Years and Cost Millions More Than Budgeted Because of Common Mistakes Made at the Contracting Stage Organizations that invest huge amounts of capital in major building industrial projects almost never do the engineering and building themselves They hire engineering and construction contractors to do it for them Unfortunately selecting contractors and negotiating the terms of a major project is one of the most difficult aspects of project management and organizations waste billions of dollars and bake in months or years of delay by doing it wrong Contracting is also the area of project management that is most prone to firmly held opinions unencumbered by any facts We intend to remedy that situation with this book Drawing on a properietary detailed database of over 1100 major projects the world s leading industrial engineering project consultant Ed Merrow explains Key Principles of Contracting for Major Projects Owners are from Mars contractors are from Venus All the biggest risks in contracting belong to the owner Contracting games will normally be won by contractors not owners Most risk transfer from owners to contractors is an illusion Contractors do good projects well and bad

projects poorly Contractors may have shareholders but they are not your shareholders Mixing different contract types with different contractors on the same project is unwise Economize on the need for trust trust only when being trustworthy has value Merrow also explains Which contract incentives work and which don t and WHY Which of over a dozen contracting strategies work best and which ones hardly ever work and WHY The strategic advice in this book is designed for owners and contractor project managers team members and supply chain executives and other business leaders involved in major projects It s also an indispensable resource for engineers leaders of industrial firms bankers and academics studying the messy realities of the construction and engineering industries   *Designing for Network and Service Continuity in Wireless Mesh Networks* Parth H.
