

Classification of drug-food interactions:

Drug-nutrient interactions could be classified into one of five broad categories. The many types of drug-nutrient interactions could thus be categorized with each having an identified precipitating factor and an object of the interaction. In some cases, the drug is the precipitating factor (i.e., causing changes to nutritional status), while in others the drug is the object of the interaction (i.e., changes in drug disposition or effect result from a nutrient, food, or nutritional status). In the event of the precipitating factor produces significant change in the object of the interaction, drug-nutrient interactions are considered as important. Interactions that need to be totally avoided are not common; instead close monitoring with modification to the dosing schedule is usually all that is necessary.
