Subrecursive Programming Systems James S. Royer, John Case, 1994-08-01 1 1 What This Book is About This book is a study of subrecursive programming systems efficiency program size trade offs between such systems and how these systems can serve as tools in complexity theory Section 1 1 states our basic themes and Sections 1 2 and 1 3 give a general outline of the book Our first task is to explain what subrecursive programming systems are and why they are of interest 1 1 1

Subrecursive Programming Systems A subrecursive programming system is roughly a programming language for which the result of running any given program on any given input can be completely determined algorithmically Typical examples are 1 the Meyer Ritchie LOOP language MR67 DW83 a restricted assembly language with bounded loops as the only allowed deviation from straight line programming 2 multi tape Turing Machines each explicitly clocked to halt within a time bound given by some polynomial in the length of the input see BH79 HB79 3 the set of seemingly unrestricted programs for which one can prove 1 termination on all inputs see Kre51 Kre58 Ros84 and 4 finite state and pushdown automata from formal language theory see HU79 Or more precisely the collection of programs p of some particular general purpose programming language $e.g.$ Lisp or Modula 2 for which there is a proof in some particular formal system $e.g.$ Peano Arithmetic that p halts on all inputs *Subrecursive Programming Systems* James S. Humanity's most basic intellectual quest to decipher nature and master it has led to numerous efforts to build machines that simulate the world or communicate with it Bus70 Tur36 MP43 Sha48 vN56 Sha41 Rub89 NK91 Nyc92 The computational power and dynamic behavior of such machines is a central question for mathematicians computer scientists and occasionally physicists Our interest is in computers called artificial neural networks In their most general framework neural networks consist of assemblies of simple processors or neurons each of which computes a scalar activation function of its input This activation function is nonlinear and is typically a monotonic function with bounded range much like neural responses to input stimuli The scalar value produced by a neuron affects other neurons which then calculate a new scalar value of their own

This describes the dynamical behavior of parallel updates Some of the signals originate from outside the network and act as inputs to the system while other signals are communicated back to the environment and are thus used to encode the end result of the computation

Programming Environments for Massively Parallel Distributed Systems Karsten M. Decker,Rene M. Rehmann,2013-04-17 Massively Parallel Systems MPSs with their scalable computation and storage space promises are becoming increasingly important for high performance computing The growing acceptance of MPSs in academia is clearly apparent However in industrial companies their usage remains low The programming of MPSs is still the big obstacle and solving this software problem is sometimes referred to as one of the most challenging tasks of the 1990 s The 1994 working conference on Programming Environments for Massively Parallel Systems was the latest event of the working group WG 10 3 of the International Federation for Information Processing IFIP in this field It succeeded the 1992 conference in Edinburgh on Programming Environments for Parallel Computing The research and development work discussed at the conference addresses the entire spectrum of software problems including virtual machines which are less cumbersome to program more convenient programming models advanced
