Poulton, 1994 The many alternative fuels that have been reviewed in this book are likely to be of great interest to a broad readership not only to mechanical petrochemical and transportation engineers but anyone with a technical association with the subject The book covers fuels for the motor vehicle and how they may develop and change in the future Prospects for conventional petrol and diesel fuels are discussed including their reformulation as well as synthetic fuels vegetable oils and other biofuels alcohols gases LPG natural gas and hydrogen and electricity This book has been published as a consequence of a programme of study commissioned by the Chief Mechanical Engineer's Office at the UK Department of Transport into the contribution of the road vehicle to global warming A programme of research was placed with the Environment Centre of the Transport Research Laboratory and one of the individual projects was to investigate the future prospects for conventional and alternative fuels for road vehicles Implications for the energy and emissions from the whole fuel cycle from production to distribution and final usage were considered but more importantly the vehicular fuel consumption and consequent carbon dioxide emissions and exhaust emission characteristics were the primary focus of attention The structure of this book is such that each chapter describes a particular alternative fuel and is completely self contained The reader will be able to cover a particular subject that is of interest without having to refer to other chapters to gain a full understanding of the fuel's characteristics notable developments and demonstration programmes underway worldwide One chapter chapter 10 does provide an overview and inter comparison of all the fuels discussed including point of use and life cycle emissions global warming impacts fuel storage implications and likely costs Future advances in conventional engines and the development of alternative power units are discussed in the companion volume to this book Alternative Engines for Road Vehicles The future prospects for a range of engines including conventional petrol and diesel fuelled units covering technologies such as two stroke lean burn and stratified charge the rotary engine gas turbine Stirling Rankine steam engine and hybrids are assessed for their potential to reduce vehicle emissions and improve fuel economy Other less well known concepts such as catalytic combustion the

Swart, 2012-12-06 The background This volume contains the proceedings of the first International symposium on Non CO₂ Greenhouse Gases Why and How to Control held in Maastricht The Netherlands from 13-15 December 1993 Of the known greenhouse gases political attention to date has been primarily focused on carbon dioxide CO₂ and the 2 CFCs the latter because of their interaction with stratospheric ozone The other greenhouse gases notably methane CH₄ nitrous oxide N₂O HCFCs HFCs and tropospheric ozone and its precursors nitrogen oxides NO_x

carbon monoxide CO and volatile organic compounds VOCs may appear collectively to be of equal importance for global warming but have attracted less attention Nevertheless a comprehensive approach to climate change response taking into account all sources and sinks of all greenhouse gases is explicitly allowed in the Framework Convention on Climate Change The Netherlands policy on climate already addresses all greenhouse gases In order to stimulate the development of international climate policy on this subject the Dutch Ministry of Housing Physical Planning and Environment supported the initiative of organizing an international symposium on the science and policy of the non CO greenhouse gases An important rationale behind this initiative was recognizing that for the non CO greenhouse gases abatement options are available that do not only address other environmental problems but that also do not require the major structural changes in society that an effective CO policy may
