*Modern Analytical Electromagnetic Homogenization* Tom G Mackay, Akhlesh Lakhtakia, 2015-07-01

Electromagnetic homogenization is the process of estimating the effective electromagnetic properties of composite materials in the long wavelength regime wherein the length scales of nonhomogeneities are much smaller than the wavelengths involved This is a bird's eye view of currently available homogenization formalisms for particulate composite materials It presents analytical methods only with focus on the general settings of anisotropy and bianisotropy The authors largely concentrate on effective materials as opposed to equivalent materials and emphasize the fundamental but sometimes overlooked differences between these two categories of homogenized composite materials The properties of an effective material represents those of its composite material regardless of the geometry and dimensions of the bulk materials and regardless of the orientations and polarization states of the illuminating electromagnetic fields In contrast the properties of equivalent materials only represent those of their corresponding composite materials under certain restrictive circumstances
