Sudden Death and the Myth of CPR Stefan Timmermans, 1999-07-27 *Sudden Death and the Myth of CPR* is for anyone who has taken a CPR course or who believes the images from television dramas It is also for families of victims and survivors of CPR It will engage emergency personnel others in the medical field and anyone concerned with ethical issues of death and dying Anyone who has ever taken a CPR course has wondered What would happen if I actually had to use CPR In Western societies the lifesaving power of resuscitation has the status of a revered cultural myth It promises life in the face of sudden death but the reality is that lives are rarely saved Medical researchers estimate the survival rate for out of hospital CPR to be between 1 and 3 percent *Sudden Death and the Myth of CPR* explores the history of this medical innovation and the promotion of its effectiveness The overuse of resuscitation Timmermans explains defines people's experience with sudden death something he learned firsthand by following the practice of lifesaving from street corner to emergency room He argues that very few people are successfully resuscitated without brain damage despite the promotion of CPR's effectiveness through powerful media images In vivid accounts of the day to day practices of

cardiopulmonary resuscitation in one of the only studies of sudden death Timmermans records the astonishingly frank comments of emergency personnel Doctors nurses social workers and paramedics express emotions from cynicism about going through the futile motions to genuine concern for victims family members If a person who was supposed to keep on living dies at the end of a resuscitative attempt how socially meaningful is the dying Timmermans asks tough questions and addresses the controversial ethical issues about the appropriateness of interfering with life and death He suggests policy reform and the restoration of dignity to sudden death

Congestive Heart Failure J. Morganroth, E. Neil

Moore, 2012-12-06 About 2.5 million individuals have congestive heart failure in the United States with over 400,000 new cases expected annually Congestive heart failure also is one of the commonest causes for hospital admissions accounting for over 5 million hospital days per year Despite the early recognition of this condition and active medical research into both mechanisms and therapy prognosis continues to remain dismal with less than a 50% expected five year survival In the last decade we have seen many new medical and therapeutic options for patients with congestive heart failure which extend beyond the use of bed rest sodium restriction digitalis and diuretics These include vasodilators of a variety of types including the angiotensin converting enzyme ACE inhibitors Also many new inotropes are under active investigation both in oral and intravenous forms In March of 1984 a survey of over 5000 physicians was performed under the auspices of the American Heart Association reported in JAOG 8:966 1986 That survey showed that there was no universally accepted definition for congestive heart failure and that a wide spectrum of diagnostic criteria for this common condition existed even among academic cardiologists There was no clear standard as to even the most basic treatment of congestive heart failure For example exercise restriction was recommended by 19% of physicians 31% recommended no change in activity and 50% either light exercise or an exercise conditioning program
