Victoria's reptiles are not often encountered by urban dwellers with many species now threatened. You may have glimpsed a skink darting into the undergrowth, a snake slithering along a walking path or a blue-tongued lizard sunning itself near your garden shed. Yet the turtles, skinks, geckos, goannas, snakes and other reptiles that call Victoria home are fascinating and important members of urban and rural ecosystems. *Reptiles of Victoria* is the first regional guide to all reptiles known to occur in Victoria. It contains keys and illustrated descriptions to allow identification of the 123 native, introduced and vagrant reptile species and describes their biology, ecology, distributions and the habitats in which they live. It also indicates the level of risk that the venomous snakes pose to humans and includes a brief section on first aid for snake bites. Natural history enthusiasts and professional and amateur herpetologists will find this an essential guide.

*The Action Plan for Australian Lizards and Snakes 2017* Nicola Mitchell, Neil Cox, Philip Bowles, Reid Tingley, Stewart Macdonald, Glenn Shea, J. Scott Keogh, John Woinarski, David Chapple, 2019-12-01

Lizards and snakes (squamate reptiles) are the most diverse vertebrate group in Australia with approximately 1000 described species representing about 10% of the global squamate diversity. Squamates are a vital part of the Australian ecosystem but their conservation has been hindered by a lack of knowledge of their diversity, distribution, biology and key threats. *The Action Plan for Australian Lizards and Snakes 2017* provides the first comprehensive assessment of the conservation status of Australian squamates in 25 years. Conservation assessments are provided for 986 species of Australian lizards and snakes, including sea snakes. Over the past 25 years there has been a substantial increase in the number of species and families recognised within Australia. There has also been an increase in the range and magnitude of threatening processes with the potential to impact squamates. This has resulted in an increase in the proportion of the Australian squamate fauna that is considered Threatened. Notably over this period the first

known extinction post European settlement of an Australian reptile species occurred an indication of the increasingly urgent need for better knowledge and management of this fauna Six key recommendations are presented to improve the conservation management and plight of Australian squamates This Action Plan represents an essential resource for research scientists conservation biologists conservation managers environmental consultants policy makers from Commonwealth and State Territory governments and the herpetological community

Chapters include colorful photographs and illustrations and collectively they convey information on topics that include ecology, behavior, biogeography, physiology, adaptation, and evolutionary biology. An introductory chapter presents a review and perspective on the historical importance of island ecology and how snakes have contributed to our understanding of evolution and adaptation. The other chapters focus on snakes inhabiting islands associated with Asia, Australia, South America, North America, the Caribbean, and Europe.
