Abed, 1994-04 This Proceedings volume contains 14 papers from the symposium Siliceous Phosphatic and Glauconitic Sediments of the Tertiary and Mesozoic which was held during the 29th International Geological Congress Kyoto Japan 24 August 3 September 1992 The first part of this volume consists of papers dealing with Tertiary biosiliceous sediments of the Pacific Rim starting in the northwest The second part of the volume is composed of papers dealing with Tertiary and Mesozoic phosphatic rocks and phosphatebearing sequences in particular of the eastern Pacific Rim and the Middle East The articles serve to emphasize the similarities and differences between the Pacific Neogene successions and the Tethyan Mesozoic sequences of the Middle East      *Structural and Tectonic Modelling and its Application to Petroleum Geology* R.M. Larsen, H. Brekke, B.T. Larsen, E. Talleraas, 2013-10-22 This monograph presents a unique combination of structural and tectonic modelling with applied petroleum geological problems Focussing on the Norwegian Continental Shelf and neighbouring areas it includes discussion covering all scales from development of sedimentary basins to formation of fractures and joints on a microscale and from exploration to the exploitation of hydrocarbons The book s coverage of structural and tectonic modelling petroleum geology applications and the treatment of the Norwegian Continental Shelf should make this book an invaluable resource book for advanced students of structural and tectonic modelling teachers and researchers as well as for geologists and geophysicists in the petroleum industry      *Nearshore Marine Paleoclimatic Regions, Increasing Zoogeographic Provinciality, Molluscan Extinctions, and Paleoshorelines, California* Clarence A. Hall, 2002 Approximately 3000 middle and late Cenozoic nearshore marine molluscan taxa from western California are assigned to six time periods spanning 25 m y In this interdisciplinary study western California is palinspastically restored for each of the time periods by backsliding and back rotating large fault blocks or crustal units Marine fossil assemblages are assigned to nearshore paleoclimatic regions or water masses within palinspastically restored California In addition this volume reveals positive feedback mechanisms between paleolatitudinal changes in sea surface paleotemperature gradients and changes in the diversity of marine mollusks along the California coast through time defines equable based effective temperatures and analyzes extinction rates among macroinvertebrate marine taxa from coastal California and the possible causes of these extinctions The late Paleogene to Neogene faunas reflect an increase in faunal diversity related to strengthened temperature gradients greater extremes in sea surface temperatures reduction in temperateness and the development of an embayed California coastline      *The Monterey Formation of California and the Origin of Its Siliceous Rocks* Milton Nunn Bramlette, 1946      Classic Cordilleran Concepts Eldridge M.

Wolf, 1992-05-19 The present volume is an intellectual agglomeration covering a variety of topics in diagenesis It starts with the diagenesis of marine pore waters and soft sediment deformations followed by two chapters on sandstones one on climatic influence in terrestrial sandstone diagenesis and the other on the deep sea volcanoclastic sandstones Diagenesis of carbonates is treated next with one chapter on compactional diagenesis and another devoted to a case study Aymestry Limestone Beds UK There are two chapters on the origin and migration of oil a maturation of organic matter and b relation of diagenesis to mineralization and hydrocarbon reservoir development followed by a chapter on sedimentary ore genesis banded iron formation In conclusion there are two chapters on paleosols This book will be of interest to geologists geochemists and petroleum engineers **U.S. Geological Survey Bulletin**, 1983 **The Thermal Regime of Santa Maria Province, California** Margaret L. Howard, Samuel Y. Johnson, Caroline M. Isaacs, M. D. Medrano, Peter S. Galanis, Frederick V. Grubb, Thomas H. Moses, 1983 Phosphatic concretions occur within diatomite in the upper part of the Miocene Monterey Formation near Lompoc Calif Absence of disruption of fine laminar bedding in the associated sediment by the concretions shows that they formed after complete compaction of the enclosing sediment The concretions exhibit a strongly concentric color chemical and mineralogic zonation Many of them are composed of a nucleus in which vivianite is the dominant mineral Amorphous ferric phosphate mitridatite and francolite are the dominant phosphatic phases in successive layers toward the surface of the concretions Cd and As contents increase tenfold from the nucleus outward reaching a maximum of 2 000 ppm whereas Ni content with a maximum of 720 ppm and Co content show the opposite trend This mineralogy and elemental composition favor accretion under conditions of continuously increasing Eh and pH during uplift into the fresh ground water zone of the terrestrial environment Shale normalized rare earth element patterns however suggest a marine source for the elements biogenic debris consisting of opal A organic matter and carbonates of the enclosing sediment **Sedimentology Review 1** V.
