Several discoveries are noteworthy for allowing us to probe the recesses of the virus infected cell and to search for cryptic viral genomes which might provide clues in our studies of cancer etiology or developmental biology One of the most notable was the discovery of reverse transcriptase This marked a momentous occasion in the history of molecular biology Not only did it provide insight into the mechanism of persistence of retroviruses but it also provided us with an enzyme that could synthesize a DNA copy of any RNA This DNA copy could then be used as a hybridization reagent to search for both complementary DNA and viral specific RNA Thus one could follow the course of any viral infection or probe in tumor cells for hidden viral genomes Second a great deal of credit must be given to the geneticists who isolated the various deletion mutants in the avian retrovirus system and thus provided us with the first means of isolating gene specific probes Finally the laboratories which have mapped the genome have provided us with the framework in which to ask very specific questions with our gene specific probes Recently numerous excellent reviews concerning various aspects of the retroviruses have appeared In this review I shall not even attempt to present a comprehensive review of retroviruses

In the past ten years there has been enormous progress in the development of eukaryotic viral vectors In general these vectors have been developed for one of three reasons to achieve high levels of expression of a particular gene product poxvirus baculovirus and adenovirus to clone eukaryotic genes in combination with functional assays Epstein Barr virus of for use as delivery vehicles for the stable introduction of foreign genes into mammalian cells retroviruses Epstein Barr virus and adeno associated virus Each vector has its strengths and weaknesses that are rooted in the sometimes bewildering strategies that the parent viruses use for propagation No one of these vectors is appropriate for all of the problems that a molecular biology laboratory is likely to encounter and few of us are knowledgeable in the molecular virology of all of these viruses This volume represents an attempt by the authors to assemble a review of these vectors in one place and in a form useful to laboratories that do not necessarily have experience with eukaryotic viruses Clearly any virus can be modified to serve as a vector for some purposes and it was not possible to include a description of all of these In addition one eukaryotic vector SV40 the first one developed has been reviewed so widely that we saw no reason to include it here
