

Reception of sound

In mammals, sound waves are collected by the external, cartilaginous part of the ear, called the **pinna**. Then they travel through the auditory canal and cause vibration of the thin diaphragm called the **tympanum** (ear drum), the innermost part of the outer ear.

Interior to the tympanum is the middle ear, which holds three small bones (**ossicles**) that transfer energy from the moving tympanum to the inner ear: the **malleus** (hammer), **incus** (anvil), and **stapes** (stirrup). The ossicles are unique to mammals, and they are homologous to bones in a fish mouth: the bones that support gills in fish are thought to be adapted for use in the vertebrate ear over evolutionary time.

Sound Reception In Mammals

Michael Hoelscher

Sound Reception In Mammals:

Eventually, you will extremely discover a other experience and finishing by spending more cash. nevertheless when? complete you receive that you require to acquire those all needs in the same way as having significantly cash?
