Practical Handbook of Curve Design and Generation

David H. von Seggern, 1994-03-08 Computers are now being used virtually everywhere in arts drafting and design to generate curves and surfaces ranging from the elementary to the intricate Practical Handbook of Curve Design and Generation is a ready reference that presents the basic mathematics of curves in a complete clear manner that enables you to apply the material to your own work with minimum effort By knowing how curves are mathematically generated and how their shape is controlled you can more fully exploit available computer tools modify these tools themselves and provide input for others to modify them It will also help you to identify mathematical equations required to produce specific curves The book does not require a heavy mathematical background if you understand elementary algebra and trigonometry you can fully apply the material presented Essential mathematical concepts are repeated in the book to reinforce your knowledge of those topics Featuring some 300 graphic examples the book is organized so that early chapters cover fundamental polynomial trigonometric and exponential forms The mathematical transformation of curves is then treated in order to give you a general approach for modifying known curves Later chapters introduce complex curves that can be composed from the building blocks presented in earlier chapters The final chapters cover interesting ideas in space curves and in surfaces

Algorithmic and Computational Robotics Bruce Donald, Kevin Lynch, Daniela Rus, 2001-04-21 Algorithms that control the computational processes relating sensors and actuators are indispensable for robot navigation and the perception of the world in which they move Therefore a deep understanding of how algorithms work to achieve this control is essential for the development of efficient and usable robots in a broad field of applications

Chaos and Fractals Heinz-Otto Peitgen, Hartmut Jürgens, Dietmar Saupe, 2013-06-29 For almost 15 years chaos and fractals have been riding a wave that has enveloped many areas of mathematics and the natural sciences in its power creativity and expanse

Traveling far beyond the traditional bounds of mathematics and science to the distant shores of popular culture this wave captures the attention and enthusiasm of a worldwide audience The fourteen chapters of this book cover the central ideas and concepts of chaos and fractals as well as many related topics including the Mandelbrot Set Julia Sets Cellulair Automata L systems Percolation and Strange Attractors Each chapter is closed by a Program of the Chapter which provides computer code for a central experiment Two appendices complement the book The first by Yuval Fisher discusses the details and ideas of fractal images and compression the second by Carl J G Evertsz and Benoit Mandelbrot introduces the foundations and implications of multifractals

Variational and Level Set Methods in Image Segmentation Amar Mitiche, Ismail Ben Ayed, 2010-10-22 Image segmentation consists of dividing an image domain into disjoint regions according to a characterization of the image within or in between the regions Therefore segmenting an image is to divide its domain into relevant components The efficient solution of the key problems in image segmentation promises to enable a rich array of useful applications The current major application areas include robotics medical image analysis remote sensing scene understanding and image database retrieval The subject of this book is image segmentation by variational methods with a focus on formulations which use closed regular plane curves to define the segmentation regions and on a level set implementation of the corresponding active curve evolution algorithms Each method is developed from an objective functional which embeds constraints on both the image domain partition of the segmentation and the image data within or in between the partition regions The necessary conditions to optimize the objective functional are then derived and solved numerically The book covers within the active curve and level set formalism the basic two region segmentation methods multiregion extensions region merging image modeling and motion based segmentation To treat various important classes of images modeling investigates several parametric distributions such as the Gaussian Gamma Weibull and Wishart It also investigates non parametric models In motion segmentation both optical flow and the movement of real three dimensional objects are studied
