1

There is nothing in the known universe to compare with the human brain. For all we know, the universe itself may be a fiction of the brain, a construct put together by that three-pound mass of squishy tissue to make vibrations from the outside understandable to the living thing inside the rampart of the skull. The vibrations come in many forms: short wavelengths that the brain calls light, longer cadences the brain knows as thunder, and a universe of things beyond and in between. But would any of them exist were it not for the brain's compulsion to organize and define? It is an ancient question that has no answer.

In today's world, the brain is the ultimate "black box," something apart and immutable that makes everything else work—the "given" in every human equation. People who study the brain say it creates only a very few new nerve cells (neurons) after birth, but loses many. In that sense, you are born with what you have, for better or for worse, for the rest of time.

But that doesn't make the brain a thing set in concrete, unchangeable. It is a living organ and all living things change. People do good things to the brain and bad things, usually without a thought to the effects. Some researchers argue that the brain wears out with age. Others insist it has to be used to keep it functioning. Probably both are true.

While the brain gives up its secrets slowly, many surprises are turning up: hints in animals that a little daily handling of

The brain contains neurons, which generate and transmit electrical signals to other neurons, and glial cells, which nurture and protect the neurons. Blood vessels bring oxygen and glucose to neurons and glial cells, and the blood also carries hormones to the brain.
