The Human Population:

The Human Population Charles F. Gritzner, 2009 How many is too many In regard to the human population people have been asking this question for centuries The current world population is approaching seven billion people At the current 1.2 per cent rate of annual increase the population will reach a whopping 9.5 billion people by 2050 The Human Population explores whether this statistical information is cause for alarm examining the issues of feeding such a population sustaining natural resources having enough living space and other necessities for a comfortable life on Earth Is the world suffering from a terrible population explosion or is life getting better for most people despite a growing population These are some of the questions and issues covered in the pages of this fascinating timely new book The Human Population, 1974 The growth rate of the populations of the industrialized nations is approaching zero as both birth and death rates decline Accompanying this transition has been as radical change in the nature of the family and of the role of women These changes constitute a kind of biological revolution a consequence of that other revolution the industrial In the underdeveloped countries zero population growth seems an almost impossible goal Some underdeveloped countries have population doubling times of less than 25 years owing to an improved medical technology that is reducing death rates while having little effect on fertility Still there are reasons to believe that this explosive growth an anomaly in the history of our species is only an early stage in the transition to an industrial economy a higher material standard of living and eventually a much lower rate of population growth Whatever happens it seems certain that before zero growth is attained the world's population will have at least doubled eight billion human beings is a conservative estimate of the total Zero or near zero growth will come but the important questions are when and how The speed with which the industrial revolution comes to the underdeveloped countries will determine whether growth will be stemmed by a high death rate starvation or by a low birth rate This collection of articles from Scientific American gives a comprehensive view of the demographic problems facing humanity today Abundantly illustrated and clearly written The Human Population is essential supplementary reading for all courses dealing with these problems

Human Population Richard P. Cincotta, Larry J. Gorenflo, 2011-02-08 In this volume the dynamic patterns of human density and distribution are examined in relation to the viability of native species and the integrity of their habitats Social biological and earth scientists describe their models outline their conclusions from field studies and review the contributions of other scientists whose work is essential to this field The book starts with general theories and broad empirical relationships that help explain dramatic changes in the patterns of the occurrence of species changes that have developed in parallel with human population growth migration and settlement In the following chapters specific biomes and ecosystems are highlighted as the context for human interactions with other species A discussion of the key themes and findings covered rounds out the volume All in all the work presents our species Homo sapiens as what we truly have been and will likely remain an influential and often the most influential constituent in nearly every major

Human Population Genetic Research in Developing Countries Yue Wang,2013-11-12 Human population genetic research HPGR seeks to identify the diversity and variation of the human genome and how human group and individual genetic diversity has developed This book asks whether developing countries are well prepared for the ethical and legal conduct of human population genetic research with specific regard to vulnerable target group protection The book highlights particular issues raised by genetic research on populations as a whole such as the potential harm specific groups may suffer in genetic research and the capacity for current frameworks of Western developed countries to provide adequate protections for these target populations Using The People s Republic of China as a key example Yue Wang argues that since the target groups of HPGR are almost always from isolated and rural areas of developing countries the ethical and legal frameworks for human subject protection need to be reconsidered in order to eliminate or at least reduce the vulnerability of those groups While most discussion in this field focuses on the impact of genetic research on individuals this book breaks new ground in exploring how the interests of target groups are also seriously implicated in genetic work In evaluating current regulations concerning prevention of harm to vulnerable groups the book also puts forward an alternative model for group protection in the context of human population genetic research in developing countries The book will be of great interest to students and academics of medical law ethics and the implications of genetic research **Biological Diversity in Human Population** Mr. Rohit Manglik,2023-11-23 Genetic and biological diversity in humans Covers population genetics adaptations and health

essential for understanding human biological variation Human Population Genetics P.P. Majumder, 2012-12-06 J B S Haldane R A Fisher and Sewall Wright simultaneously and largely independently laid the foundations of population genetics and the mathematical theory of evolution Haldane was born on November 5 1892 Although he primarily worked at the University College London UCL in 1957 he resigned from the UCL and joined the Indian Statistical Institute Calcutta India as a Research Professor In celebration of his birth centenary the Indian Statistical Institute organized an International Conference on Human Genetics from 15 to 19 December 1992 The prime motive in holding this Conference was to bring together a group of scientists geneticists anthropologists clinicians and statisticians to evaluate the impact of Haldane's contributions to various areas of human genetics and also to review recent developments in the subject Session and lecture themes were so chosen that they covered areas theoretical and applied classical and emerging Speakers were then identified and invited to deliver lectures on these themes Manuscripts of all invited presentations and a selected number of contributed presentations were considered for inclusion in this Proceedings Volume Each manuscript was reviewed by at least one Conference participant which resulted in revision of several manuscripts and rejection of some This volume is a collection of the manuscripts which have been accepted after the review process The Conference began with the J B S Haldane Centenary Lecture delivered by C R Rao Impacts of Human Population on Wildlife Trevor J. C. Beebe, 2022-06-30 Wildlife and the countryside are highly valued by people in the UK and for good reason Healthy habitats are invaluable assets and promote human wellbeing However they are under increasing threat from among other things relentless urban expansion and intensive modern agriculture These pressures largely stem from a major underlying cause the high and growing population of humans living in the UK This book provides an overview of wildlife in the UK and its recent status factors contributing to wildlife declines trends in human numbers international deliberations about the impacts of human population growth and the implications for the future of wildlife conservation in the UK The evidence based text includes comparisons of wildlife declines and their causes in other countries providing a global perspective This book is for ecologists naturalists and conservation biologists studying and working in academia or in consultancies as well as all those interested in wildlife conservation **The Human Population** , 1974-01-01 Individual Susceptibility to Genotoxic Agents in the Human Population Frederick J. De Serres, Ronald W. Pero, William Sheridan, 2012-12-06 As a result of the industrial revolution man's technological achievements have been truly great increasing the quality of life to almost unimaginable proportions but all this progress has not been accomplished without equally unimaginable health risks Sufficiently diagnostic short term assay procedures have been developed in recent years for us to determine that there are mutagenic agents among thousands of chemicals to which the human population is exposed today These chemicals were not significantly present prior to the industrial revolution As of today there are no procedures available which have been adequately demonstrated to assess individual susceptibility to genotoxic exposures and as a result we have had to rely on extrapolating toxicological data from animal

model systems The question is can we afford to allow such an increased environmental selection pressure via mutagenic exposures to occur without expecting adverse long term effects on our health It is apparent from this line of reasoning that what is lacking and immediately needed are test procedures that can be applied to humans to assess genotoxic exposure as well as individual susceptibility to it There have already been two conferences which have focused attention on this research area Guidelines for studies of human populations exposed to mutagenic and reproductive hazards A D Bloom ed March of Dimes Birth Defects Foundation White Plains New York 1981 and Indicators of genotoxic exposure in humans Banbury Report 13 B A Bridges B E Butterworth and I B Human Population and the Environmental Crisis Ben Zuckerman, David Jefferson, 1996 Discusses environmental problems policies ethical and scientific concerns arising from the impact of overpopulation on our planet On Describing the Structure and Development of a Human Population System ,
