Slope Geomorphology Critical Concepts In Geography:

Geomorphology David J. A. Evans, 2004-07-15 Geomorphology concerns the forms of the land's surface and the processes that create them. It is an integral part of studies in physical geography and also has significant bearing on geology and engineering. Since the nineteenth century many systems of classifying landforms have been devised and this has led to recognized areas of specialist study, most notably fluvial, slope, coastal, glacial and periglacial, arid lands and landscape evolution. This collection makes available in one place key published material on each of these areas of geomorphology and constitutes an instant archive of essential benchmark papers. By drawing together classic as well as more contemporary material, each volume provides an overview of each field and its development as well as a sense of where current debates are leading. The set as a whole provides representative coverage of the changing perspectives in the study of geomorphology over the past 100 years. The papers have been chosen by specialist editors working with the general editor David J. A. Evans and include introductions to each volume to set the selection in its intellectual and historical context.

Fundamentals of Geomorphology Reader in Geography Richard Huggett, 2007-07 This extensively revised and updated edition continues to present an engaging and comprehensive introduction to the subject, exploring the world's landforms from a broad systems perspective. It reflects on the latest developments in the field and includes new chapters on geomorphic materials and processes, hillslopes and changing landscapes. *Fundamentals of Geomorphology* is an engaging and comprehensive introduction. Starting with a consideration of the nature of geomorphology and the geomorphic system, geomorphic materials and processes, and the quest of process and historical geomorphologists, it moves on to discuss structure landforms resulting from or influenced by the endogenic agencies of tectonic and volcanic processes, geological structures and rock types, process and form landforms resulting from or influenced by the exogenic agencies of weathering, running water, flowing ice and meltwater, ground ice and frost, the wind and the sea, history, earth surface history, giving a discussion of Quaternary landforms and ancient landforms including the origin of old plains, relict, exhumed and stagnant landscape features and evolutionary aspects of landscape change. *Fundamentals of Geomorphology* provides a stimulating and innovative perspective on the key topics and debates within the field of geomorphology. Written in an accessible and lively manner, it includes guides to further reading, chapter summaries and an extensive glossary of key terms. The book is also illustrated throughout with over 200 informative diagrams and attractive photographs, including a colour plate section.

Earth Environments David Huddart, Tim A. Stott, 2013-04-16 This book provides a comprehensive coverage of the major topics within undergraduate study programmes in geosciences, environmental science, physical geography, natural hazards and ecology. This text introduces students to the Earth's four key interdependent systems: the atmosphere, lithosphere, hydrosphere and biosphere, focussing on their key components, interactions between them and environmental change. Topics covered include: An earth systems model, components, systems and processes, atmospheric systems, oceanography, endogenic geological systems and

exogenic geological systems biogeography and aspects of the Earth's Record The impact of climate and environmental change is discussed in a final chapter which draws together Earth's systems and their evolution and looks ahead to future earth changes and environments and various time periods in the geological record Throughout the book geological case studies are used in addition to the modern processes
