Smart Learning with Educational Robotics Linda Daniela, 2019-06-28 This book will offer ideas on how robots can be used as teachers assistants to scaffold learning outcomes where the robot is a learning agent in self directed learning who can contribute to the development of key competences for today's world through targeted learning such as engineering thinking math physics computational thinking etc starting from pre school and continuing to a higher education level Robotization is speeding up at the moment in a variety of dimensions both through the automation of work by performing intellectual duties and by providing support for people in everyday situations There is increasing political attention especially in Europe on

educational systems not being able to keep up with such emerging technologies and efforts to rectify this This edited volume responds to this attention and seeks to explore which pedagogical and educational concepts should be included in the learning process so that the use of robots is meaningful from the point of view of knowledge construction and so that it is safe from the technological and cybersecurity perspective *AI and Cognitive Modelling for Education* Boris Aberšek, Andrej Flogie, Igor Pesek, 2023-07-30 This book offers a groundbreaking approach to bridging the gap between various disciplines involved in cognitive modeling in education By drawing on the fields of learning neuro science cognitive science neurobiology and computer science it provides a new perspective on how we can integrate these disciplines with education to create more effective learning environments The main objective of this book is to delve into the ethical sociological and technological questions surrounding the introduction of intelligent and smart learning environments in education By analyzing these issues this book aims to bridge the gap between the various disciplines involved in cognitive modeling and education while highlighting the benefits and risks associated with these advancements With the emergence of AI based tutors coaches and learning environments students now have access to a new type of self learning and self training that was previously unavailable Distance learning has become increasingly popular in recent years and the use of computer assisted learning tools has revolutionized the way we think about education The goal of education must be to instill in students a desire to learn for themselves and this can only be achieved through active self directed and reflective learning With intelligent tutoring systems students are empowered to take an active role in their own education rather than simply being passive recipients of information This book offers practical strategies for teachers to facilitate this transition enabling them to act as facilitators and guides rather than one way communicators By embracing this new approach to education we can help students become lifelong learners who are equipped with the skills they need to succeed in the 21st century As we cannot predict the future with certainty the true effects of education may only be revealed in the long run making it critical to understand the potential consequences of introducing these new learning tools By exploring these complex topics this book offers valuable insights for educators policymakers and anyone interested in the future of education Studying Virtual Math Teams Gerry Stahl, 2010-05-03 Studying Virtual Math Teams centers on detailed empirical studies of how students in small online groups make sense of math issues and how they solve problems by making meaning together These studies are woven together with materials that describe the online environment and pedagogical orientation as well as reflections on the theoretical implications of the findings in the studies The nature of group cognition and shared meaning making in collaborative learning is a foundational research issue in CSCL More generally the theme of sense making is a central topic in information science While many authors allude to these topics few have provided this kind of detailed analysis of the mechanisms of intersubjective meaning making This book presents a coherent research agenda that has been pursued by the author and his research group The book opens with descriptions of the project and its methodology as well as situating this

research in the past and present context of the CSCL research field The core research team then presents five concrete analyses of group interactions in different phases of the Virtual Math Teams research project These chapters are followed by several studies by international collaborators discussing the group discourse the software affordances and alternative representations of the interaction all using data from the VMT project The concluding chapters address implications for the theory of group cognition and for the methodology of the learning sciences In addition to substantial introductory and concluding chapters this important new book includes analyses based upon the author s previous research thereby providing smooth continuity and an engaging flow that follows the progression of the research The VMT project has dual goals a to provide a source of experience and data for practical and theoretical explorations of group knowledge building and b to develop an effective online environment and educational service for collaborative learning of mathematics Studying Virtual Math Teams reflects these twin orientations reviewing the intertwined aims and development of a rigorous science of small group cognition and a Web 2 0 educational math service It documents the kinds of interactional methods that small groups use to explore math issues and provides a glimpse into the potential of online interaction to promote productive math discourse
