Indian philosophy and contemplative wisdom traditions Because it permeates human existence in so many different ways the study of consciousness is a profoundly interdisciplinary endeavour and engages disciplines such as philosophy including Eastern philosophy cognitive neuroscience anthropology psychiatry and psychopathology and even physics The study of consciousness may involve domains as diverse as perceptual awareness cognition and metacognition reasoning executive control theory of mind self sleep and dreaming emotional competence and empathy It concerns both healthy e g aging meditation spiritual experiences and pathological conditions e g epilepsy neglect and locked in syndromes minimally conscious states anesthesia and involves considerations operating at different time scales e g evolution development expertise Today however and despite almost thirty years of concerted interdisciplinary efforts the nature and mechanisms of consciousness remain as elusive as ever Theoretically different conceptual frameworks aimed at characterizing both its functional and phenomenal aspects take sometimes radically different assumptions as their starting point but often fail to make sufficiently precise differential predictions to be falsifiable While most recent views generally consider methods investigating human higher order reflective or access consciousness the theoretical and experimental foundations of primary proto consciousness often remain vague and ignore evolutionary considerations Influential distinctions such as the distinction between phenomenal and access consciousness between pre reflective minimal and the reflective narrative self between graded and all or none processing or even between conscious and unconscious processing all remain unsettled or controversial The field is also rife with methodological challenges and controversies some of which remain largely unsolved Questions such as how to best measure awareness or to how establish its absence issues such as what kind of neuroscientific data would convincingly make it possible to isolate the neural correlates of consciousness or what types of confounds contaminate extant findings challenges such as how to imagine crucial experiments that are sufficiently sensitive to falsify some theoretical proposals all need to be addressed in open interdisciplinary dialogue This Frontiers Research Topic is aimed at stimulating discussion about current methodological issues and trends in consciousness research We welcome theoretical and empirical contributions as well as empirical articles from both experts and young scientists who work in the field of consciousness research Submissions of related hypotheses original research articles case reports perspectives reviews opinions and commentaries are welcome We very much hope that this Frontiers Research Topic will contribute to enhancing our characterization and understanding of the methodological and conceptual challenges associated with the study of human consciousness

The Sleep of Others and the Transformations of Sleep Research Kenton Kroger, 2007-01-01 We tend to think of sleep as a private concern a night time retreat from the physical world into the realm of the subconscious Yet sleep also has a public side it has been the focal point of religious ritual philosophic speculation political debate psychological research and more recently neuroscientific investigation and medical practice In this first ever history of sleep research Kenton Kroger draws on a wide range of material to present the story of how an investigative field at one time dominated by the study of dreams slowly morphed into a laboratory based discipline The result of this transformation Kroger argues has changed the very meaning of sleep from its earlier conception to an issue for public health and biomedical intervention Examining a vast historical period of 2500 years Kroger separates the problems associated with the history of dreaming from those associated with sleep itself and charts sleep related diseases such as

narcolepsy insomnia and sleep apnea He describes the discovery of rapid eye movement REM during the 1950s and shows how this discovery initiated the creation of dream laboratories that later emerged as centres for sleep research during the 1960s and 1970s Kroker s work is unique in subject and scope and will be enormously useful for both sleep researchers medical historians and anybody who s ever lost a night s sleep

Handbook of Psychology and Health, Volume I Robert J. Gatchel, Andrew Baum, Jerome E. Singer, 2021-09-30 Originally published in 1982 this volume deals with behavioral medicine and clinical psychology Much of what psychologists had been able to contribute to the study and treatment of health and illness had to this point been derived from clinical research and behavioral treatment This volume presents some of this work providing a fairly comprehensive view of the overlap between behavioral medicine and clinical psychology Its purpose was to present some of the traditional areas of research and practice in clinical psychology that had directly and indirectly contributed to the development of behavioral medicine Before the birth of behavioral medicine which subsequently attracted psychologists from many different areas ranging from social psychology to operant conditioning the chief link between psychology and medicine consisted of the relationship albeit sometimes fragile and tumultuous between clinical psychology and psychiatry Many of the behavioral assessment and treatment methods now being employed in the field of behavioral medicine were originally developed in the discipline of clinical psychology
