Subcellular Biochemistry Vol 16 Intracellular Transfer Of Lipid Molecules:

Subcellular Biochemistry J. Robin Harris, 2013-11-11 In Volume 25 leading experts present studies on the value of increased ascorbic acid intake and explore its specific contributions to human and animal health Intracellular Parasites José-Luis Avila, J. Robin Harris, 2013-11-11 Volume 18 of the Subcellular Biochemistry series which specializes in various aspects of the biochemistry of the intracellular parasites was initially proposed by Jose Luis Avila and strongly supported by myself as Series Editor of Sub cellular Biochemistry Considerable assistance was received from Professor Frank Wunderlich University of Dusseldorf and more particularly from Dr Michael Miles London School of Hygiene and Tropical Medicine during the compilation of the list of possible chapters Our initial aim was to present a comprehensive survey of this broad field of study Although some interesting topics have been lost due to authors backing out late in the production schedule of the book the manuscripts that were submitted have provided a useful over view of the subject with notable strength within the field of Leishmania The 13 chapters of the book have been grouped according to subject The first five chapters deal with Leishmania and are followed by two chapters on Trypanosoma cruzi two on the malarial parasites and two on the Coccidia The final two chapters cover the Microsporidia and chemotherapy respectively Mycoplasma Cell Membranes Shlomo Rottem, Itzhak Kahane, 2012-12-06 The mycoplasmas a trivial name used to denote organisms included in the class Mollicutes are a group of prokaryotic organisms comprising more than 120 species distinguished from ordinary bacteria by their small size and the total lack of cell walls The absence of a cell wall in mycoplasmas is a characteristic of outstanding importance to which the mycoplasmas owe many of their peculiarities for example their morphological instability osmotic sensitivity unique ion pumping systems resistance to antibiotics that interfere with cell wall biosynthesis and susceptibility to lysis by detergents and alcohols The fact that the mycoplasma cells contain only one membrane type the plasma membrane constitutes one of their most useful properties for membrane studies once the membrane is isolated it is uncontaminated with other membrane types Another advantage in using mycoplasmas as models for membrane studies stems from the fact that their membrane lipid composition can be altered in a controlled manner This characteristic results from the partial or total inability of the mycoplasmas to synthesize long chain fatty acids and cholesterol making mycoplasmas dependent on the supply of fatty acids from the growth medium The ability to introduce controlled alterations in the fatty acid composition and cholesterol content of mycoplasma membranes has been utilized in studying the molecular organization and physical properties of biological membranes **Endocytic Components: Identification and Characterization** J.J.M. Bergeron, J. Robin Harris, 2013-11-11 In step with the rapid growth of research into the biochemical and functional characterization of the endosome Volume 19 surveys the recent advances in the methodological aspects of this field Coverage includes the use of free flow electrophoresis to define endosome subpopulations the endosomal compartments in rat hepatocytes the role of endosomes in transmembrane signalling and six additional articles **Physicochemical**

Methods in the Study of Biomembranes Herwig J. Hilderson, Gregory B. Ralston, 2013-11-11 In mammalian cells many physiological processes rely on the dynamics of the organization of lipids and proteins in biological membranes. The topics in this volume deal with physicochemical methods in the study of biomembranes. Some of them have a long and respectable history in the study of soluble proteins and have only recently been applied to the study of membranes. Some have traditionally been applied to studies of model systems of lipids of well defined composition as well as to intact membranes. Other methods by their very nature apply to organized bilayers comprised of both protein and lipid. Van Meer and van Genderen provide us with an introduction to the field. Chapter I From their personal perspective regarding the distribution transport and sorting of membrane lipids they formulate a number of biologically relevant questions and show that the physicochemical methods described in this book may contribute in great measure to solving these issues. The methods of analytical ultracentrifugation have served faithfully for 60 years in the study of water soluble proteins. The use of detergent extraction of membrane proteins and the manipulation of density with H₂O D₂O mixtures has extended this technique to the study of proteins and in particular their interactions from biological membranes. As described by Morris and Ralston in Chapter 2 this technique can be used to determine a number of important properties of proteins.

Membrane Biogenesis A.H. Maddy, J. Robin Harris, 2013-11-11 Scientific reviews are now of two complementary types short very up to date articles as are found in the Trends series and the more traditional longer reviews which are more comprehensive but take longer to publish. The Subcellular Biochemistry series belongs to the latter category where a number of reviews on a broad topic are collected together in the one volume. It has been the aim of this volume to summarize the present state of knowledge of membrane assembly. It is appreciated that some relevant topics have not been included and an editor's selection is restricted by the many calls on potential authors who are unable to meet all requests made to them. The absence of a discussion of the roles of lipids is however a reflection of the fact that a recent volume in this series edited by Dr H. J. Hilderson has been devoted to this subject. Vol 16 Intracellular Transfer of Lipid Molecules and readers are recommended to this source.

Proteins: Structure, Function, and Engineering B.B. Biswas, Siddhartha Roy, 2013-06-29 Here researchers review the latest breakthroughs in protein research. Their contributions explore emerging principles and techniques and survey important classes of proteins that will play key roles in the field's future. Articles examine the possibility of a Boltzmann like distribution in protein substructures, the new technique of Raman spectroscopy and compact intermediate states of protein folding. This well illustrated volume also features coverage of proteins that bind nucleic acids.

Comparative Animal Biochemistry Klaus Ulrich, 2013-04-17 tribute greatly to understanding the origins of life. The plan for this book goes back almost 20 years. Already at that time it was possible to recognize organisms an extraordinary variation in metabolites and To provide the biochemist with a ready over processes superimposed upon the basic biochem view of the structural diversity of animals the book includes a simplified version of animal system of animals. Each species each individual for further information on the

classification in fact each type of cell of the multicellular organism possesses its own biochemical characterization structure and life of particular animal species and this molecular variety indicates the reader should consult the relevant text for significance and its evolutionary development books. It is assumed that the zoologist reader has thrown up many interesting questions. To obtain a basic knowledge of biochemistry, important general biochemical facts are in any case given for comparative approach that has been so productive at many of the subjects covered. The higher levels of complexity of morphology and physiology can also be used to great effect. As I had already completed several chapters of the molecular level, this book by the beginning of the 1970s. *Diet-induced Acyl Modifications of Mouse Phospholipid Classes* Alvin Berger, 1992

Endoplasmic Reticulum N. Borgese, J. Robin Harris, 2012-12-06 In step with the surge of interest in the endoplasmic reticulum, the current volume takes an integrated look at this functionally diverse organelle. Coverage includes protein translocation and export, lipid metabolism, antigen presentation and many other subjects gleaned from such diverse fields as cell biology, enzymology and membrane biochemistry, immunology and signal transduction.
