Subsymbolic Natural Language Processing An Integrated Model Of Scripts Lexicon And Memory:

Subsymbolic Natural Language Processing Risto Miikkulainen, 1993 Risto Miikkulainen draws on recent connectionist work in language comprehension to create a model that can understand natural language Using the DISCERN system as an example he describes a general approach to building high level cognitive models from distributed neural networks and shows how the special properties of such networks are useful in modeling human performance In this approach connectionist networks are not only plausible models of isolated cognitive phenomena but also sufficient constituents for complete artificial intelligence systems Distributed neural networks have been very successful in modeling isolated cognitive phenomena but complex high level behavior has been tractable only with symbolic artificial intelligence techniques Aiming to bridge this gap Miikkulainen describes DISCERN a complete natural language processing system implemented entirely at the subsymbolic level In DISCERN distributed neural network models of parsing generating reasoning lexical processing and episodic memory are integrated into a single system that learns to read paraphrase and answer questions about stereotypical narratives Miikkulainen's work which includes a comprehensive survey of the connectionist literature related to natural language processing will prove especially valuable to researchers interested in practical techniques for high level representation inferencing memory modeling and modular connectionist architectures Risto Miikkulainen is an Assistant Professor in the Department of Computer Sciences at The University of Texas at Austin

Computational Maps in the Visual Cortex Risto

Miikkulainen, James A. Bednar, Yoonsuck Choe, Joseph Sirosh, 2006-01-16 For more than 30 years the visual cortex has been the source of new theories and ideas about how the brain processes information The visual cortex is easily accessible through

a variety of recording and imagining techniques and allows mapping of high level behavior relatively directly to neural mechanisms Understanding the computations in the visual cortex is therefore an important step toward a general theory of computational brain theory
