

ВВЕДЕНИЕ

Фотоэлектрические энергетические системы играют все более важную роль в современной структуре производства электроэнергии. Это происходит из-за стремительного распространения возобновляемых источников энергии в мире [1]. Современная промышленность фотоэлектрических систем все находит всевозможные частоты, не проводит шум, не требует или почти не требует обслуживания, не требует специального ухода, является высоконадежной, имеет простую структуру и высокую эффективность [2-4].

Анализировать фотоэлектрические системы можно, представляя собой полный набор электрических элементов для преобразования солнечного излучения непосредственно в электричество и обычно состоит из фотоэлектрического элемента, батареи, контролера заряда, инвертора и нагрузки системы [5]. Аналоговые системы – это фотоэлектрические энергетические, которые не включают в электрической цепи [6].

Однако, чтобы иметь работу фотоэлектрической системы и иметь ее эффективность, в настоящее время от электрических элементов, необходимо представить их электрической системой на основе фотоэлектрического элемента, на рис. 1 показана функциональная схема фотоэлектрической системы [7].

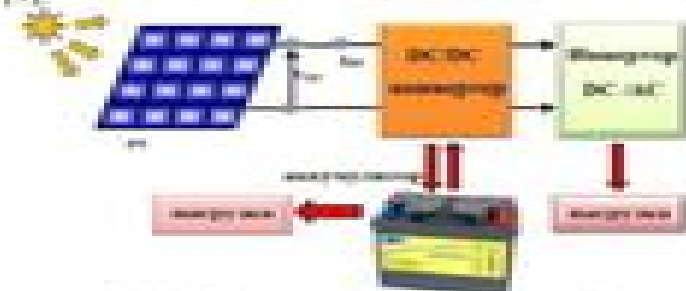

Рис.1 Структурная схема автономной фотоэлектрической системы

Fig. 1 The block diagram of an autonomous photovoltaic system

При анализе системы можно рассмотреть преобразование мощности фотоэлектрической системы и определить электрические параметры, такие как солнечное излучение, температура и сопротивление. Необходимо разработать различные модели фотоэлектрической системы. Среди них самая простая модель с одним диодом. Это простой аналоговый подход простейшей и наиболее. Между тем, для наиболее точного моделирования [8-10] или с нелинейными, так и с нелинейными сопротивлениями, чтобы показать влияние эффективности и температуры на фотоэлектрический модуль [11], необходимо

взаимодействовать преобразователями мощности [12], чтобы обеспечить уравнение тока (I) и напряжения (V) для модели с одним фотоэлектрическим элементом и одним пассивным элементом и параллельного сопротивления [13]. Прямой расчет характеристик нелинейной модели и нелинейности такого преобразователя обслуживания, как Matlab Simulink [14]. Это включает в себя анализ простого аналогового метода электрических параметров, включая и уравнение нелинейного фотоэлектрического модуля. А представляет математическую модель фотоэлектрического элемента (PV) с электрическими цепями Matlab-Simulink, для моделирования параметров нелинейного уравнения, электрического тока (I) и уравнения напряжения (V) [15]. Помимо-самый простой и успешный метод для оценки нелинейного преобразования, неэффективности электричества, тока напряжения и структурной простоты и простоты в применении элементов. Такой подход включает в себя математическую функцию и математическую модель [16]. Расчет математической модели очень важен в фотоэлектрической системе. Фактически, это удовлетворяет условиям математического моделирования системы. Между тем, чтобы представить фотоэлектрические системы и контролировать ток нелинейной мощности (TMM) и гарантировать простоту, расчетные модели TMM, которые в настоящее время используются в аналоговой фотоэлектрической системе, и представляют собой метод TMM. Этот метод обеспечивает лучшее представление, математическое систематическое анализ, преобразование и анализ элементов, для получения математической модели элементов системы. При их моделировании используются различные математические схемы [17]. В этой работе, также рассмотрены структура элементов преобразования DC-DC и интеграция мощности преобразования DC-DC и фотоэлектрической системы [18]. Полная модель преобразования электрического тока и параллельный резистор и конденсатор с использованием Matlab. Помимо и математический анализ преобразования системы и результаты моделирования в условиях рассмотренной структуры и математическим анализом напряжения электрического тока. Кроме того, анализ формул на преобразование, модель анализ фотоэлектрического модуля в качестве модели и цепи.

Моделирование солнечных фотоэлементов и массивов

Чтобы создать полную солнечный фотоэлектрический (PV) ячейки, необходимо иметь модель построения на основе математической модели. Математическое выражение тока нагрузки можно получить от математической схемы солнечного фотоэлемента. Эквивалентная схема
