Delgado, Al Mullery, 2008-01-03 Paving the Way for an Open Service Market We live in an age when powerful communications technology is becoming available to everyone From our home we can send and receive not only analogue voice but also growing volumes of digital information and even intelligence in the form of agents We are becoming increasingly mobile and are expecting the same level of connectivity in the home in the office and on the road The regulatory and commercial environment in which we communicate is changing The telecommunications market is becoming increasingly competitive The Internet is erasing the borders between information technology and telecommunications And the way we do business is ever more dominated by electronic exchanges of information Is our technology ready for the open market of networks and services Can we manage the growing complexity of computing and telecommunications technology and place it at the service of the people The challenge for the research community is to develop the tools and techniques that will ultimately bring the full power of communications and information to everyone in a way that everyone can easily use The Sixth International Conference on Intelligence in Services and Networks IS N 99 is all about technology for paving the way to the open services market Since the first IS N conference in 1992 the focus of the IS N program has continually shifted We see existing technologies maturing while new ones emerge but the bottom line has always been putting technology at the service of the people

Large Scale Networks Radu Dobrescu, Florin Ionescu, 2016-10-03 This book offers a rigorous analysis of the achievements in the field of traffic control in large networks oriented on two main aspects the self similarity in

traffic behaviour and the scale free characteristic of a complex network. Additionally the authors propose a new insight in understanding the inner nature of things and the cause and effect based on the identification of relationships and behaviours within a model which is based on the study of the influence of the topological characteristics of a network upon the traffic behaviour. The effects of this influence are then discussed in order to find new solutions for traffic monitoring and diagnosis and also for traffic anomalies prediction. Although these concepts are illustrated using highly accurate highly aggregated packet traces collected on backbone Internet links the results of the analysis can be applied for any complex network whose traffic processes exhibit asymptotic self similarity perceived as an adaptability of traffic in networks. However the problem with self similar models is that they are computationally complex. Their fitting procedure is very time consuming while their parameters cannot be estimated based on the on line measurements. In this aim the main objective of this book is to discuss the problem of traffic prediction in the presence of self similarity and particularly to offer a possibility to forecast future traffic variations and to predict network performance as precisely as possible based on the measured traffic history.
