Communications Regulation in the Age of Digital Convergence Stefan Seifert, 2009 Age of Information Aware Communication Systems Antzela Kosta, 2020-04-16 Advances in wireless communications and networking technology have taken us towards a pervasively connected world in which a vast array of wireless devices from mobile phones to environmental sensors seamlessly communicate with each other In many of these systems the freshness of the transmitted information is of high importance Characterization of time critical information can be achieved through the so called real time status updates that are messages encapsulated in packets carrying the timestamp of their generation Status updates track time varying content that needs to be transmitted from the generation point to a remote destination in a

network To quantify the freshness of information in networked systems a novel metric different from delay or latency termed as age of information AoI has been introduced In this thesis we focus on characterizing and controlling age under various communication system setups The first part of the thesis considers multiple access communication systems and comprises two papers The first paper investigates AoI in relation with throughput in a shared access setup with heterogeneous traffic More specifically we consider a shared access system consisting of a primary link and a network of secondary nodes with multipacket reception MPR capabilities To study the joint throughput timeliness performance we formulate two optimization problems considering both objectives and provide guidelines for the design of such a multiple access system satisfying both timeliness and throughput requirements In the second paper we study the AoI performance in various multiple access schemes including scheduling and random access We present an analysis of the AoI with and without packet management at the transmission queue of the source nodes considering that packet management is the capability to replace unserved packets in the queue whenever newer ones arrive We incorporate the effect of channel fading and network path diversity in such a system and provide simulation results that illustrate the impact of network operating parameters on the performance of the considered access protocols The second part of the thesis considers the characterization of AoI and other freshness performance metrics in a point to point communication link again comprising two papers In the third paper of this thesis we expand the concept of information ageing by introducing the cost of update delay CoUD metric to characterize the cost of having stale information at the destination Furthermore we introduce the value of information of update VoIU metric that captures the degree of importance of the update received at the destination We employ queue theoretic concepts and provide a theoretical analysis and insights into the prospects of cost and value Finally in the last paper we study the properties of a sample path of the AoI process and we obtain a general formula of its stationary distribution We relate this result to a discrete time queueing system and provide a general expression of the generating function of AoI in relation with the system time and the peak age of information PAoI To illustrate the applicability of the results we analyze the AoI in single server queues with different disciplines and assumptions We build upon these results to provide a methodology for analyzing general non linear age functions for this type of systems
