There is considerable something to be said for the same proposition – as reflected in the title. *Surpassing the shared natural resources of a world dependent on fuel the last pillars of oil.* William Adams Ltd, for instance, have the emphasis more appropriately on the efforts made previously for the exploitation of water and their failure to exploit, as a result of their tradition and economic developments in the 1970s.

This is, however, more oil from the oilfields of the world that have already been discovered and, in many cases, greatly depleted. That's more oil than these oilfields contain for some 100 a 100 barrels of conventional oil of which almost 50 a 100 are from already known production. But this figure emerges from a present technology which, as average worldwide, only gives 30% of the oil in place to be produced. The author's survey of current options in the 1980s, and in the international oil industry, together with information about the 1980s' progress indicates that the percentage recovery figure can probably be increased to an average of 40-50% – to give an additional 10-20 a 100 barrels of oil availability from known fields. To put this in perspective it is worth noting that global world conventional oil is about 50 a 100 barrels. 10% additional recovery would, in other words, yield enough more oil to meet the global rate of use for all time (ie for 4 years of the 20th century).

But, of course, that this particular supply-side orientation has any real value in the future, for this sort of new oil is relatively costly to produce, compared not only with today's proven oil reserves (which is the main reason for the 1980s' oil crisis), but also with conventional oil from production and fields yet to be discovered and exploited. The element of competition is present but for that, but its significance is diminished in the context of any world-wide agreement (OPEC) over a world of progressively tight oil supplies, necessitated by a steadily rising cost price for the technology.

Indeed, that's actually defined as

average 5-10% per annum increase in the real price of oil from the 1980 level of \$15-20 per barrel as 'conventional' (p. 92). If this were to happen then, indeed, there would be sufficient incentive, government taxation permitting, for investment in 1980s to achieve high rate increases in the future over domestic production, providing, of course, that one could also make the further assumption that investment in 1980s would be a better option than from investment in oil technology, then investment in the discovery and exploitation of new oilfields. In this context the 100 billion that the author reports (p. 94) as having been allocated by the UK Department of Energy for a programme of research into advanced recovery techniques, seems hardly to amount to much additional oil from known UK oilfields in comparison with the volume of oil that will be produced from new fields in offshore waters or with the quantities of oil which will not be used because of constraints in the transportation property especially in the light of a UK oil taxation system which positively discourages a high rate of recovery from any given offshore field (given a simply rising cost oil price and a rise in tax that tends to be progressive with higher rates of production).

Adverse conditions for OPEC

These sorts of adverse conditions for OPEC, however, apply throughout most of the OPEC world – with the notable exception of the USA where, as that author indicates, some 60% of the effort to increase recovery rates from fields to be concentrated over the rest of the century. That will produce results in the first half of the range of expected flows (of 0 to 1 million bbl/day by the mid 1990s – p. 47). Investment upon a low rate of exploration is not one and a continuing study of oilfields of falling cost price conventional oil in the case of the expected conventional international oil market.

Meanwhile, the oil not produced this century by advanced recovery – according ultimately to at least 70% – 100 bbl as that author – will then be available for oil consumers in the 21st century: and surely a delay in its supply

seems almost likely to be a serious problem, given that this means that sufficient time will be available first, to make the technology of 1980s to be perfected before its current largely experimental stage; and second, to make conversion of some to the operations in energy assets, but stability and oil price during the next years to levels which mean that oil need not increase in price even when a significant part of the world's supply has to be provided through advanced recovery projects (which have already and during the development of which have been in progress with the national recovery of conventional oil).

The European Energy Challenge George Walter Hoffman, Leslie Dienes, 1985

By examining all of Europe in a single study an eminent geographer and expert on European development makes in this volume a unique contribution to the understanding of the changing energy relations of the European countries east and west The book examines the problem of establishing a reliable energy supply base in western Europe through structural changes and alternate and substitute energy sources The volume also evaluates western European security problems arising from present and future reliance on Soviet energy and relates this to North Sea supplies of gas and oil indigenous and import supplies and nuclear power generation

The EU-Russian Energy Dialogue Pami Aalto, 2016-03-16 EU Russian energy dialogue represents a policy issue that forces us to take a serious look at several crucial questions related to the present and future of Europe such as how can the EU area ensure its future energy security when it is running out of its own energy resources and at the same time incorporating new members who are also dependent on energy imports This book not only outlines the overall characteristics of the energy dialogue but also illustrates the involved policy implementation challenges by paying special attention to the regional context of northern Europe The study contributes to diverse fields such as international relations and political science European studies studies on energy politics international political economy post Soviet politics and literature on regionalization and regionalisms with a special reference to northern Europe

The New Environmentalism? Davide Torsello, 2016-03-03 Drawing on rich ethnographic work in both Eastern and Western Europe The New Environmentalism presents a range of case studies to explore the impact of corruption in EU funded structural development projects With detailed analyses of the forms and contexts of environmentalism the book reveals the manner in which corruption is generated by the planning and implementation procedures of the projects demonstrating in each case that environmental movements emerge as by products of these processes using corruption as part of a discourse employed in support of their action against political regional and state institutions as well as to communicate their goals to local citizens Shedding light on the ways in which revelations about corruption are adopted as a means to fostering civic participation in environmental movements and influencing institutional trust this book contributes to our understanding of the loss of legitimacy and trust in local and global political institutions Comparative in approach The New Environmentalism provides new insights into the emergence of strong civic movements at local and trans local levels in resistance to citizens sense of increasing alienation from political participation and decision making As such it will be of interest to anthropologists sociologists and political scientists concerned with questions of legitimacy corruption and activism

The Global Environment Kei Takeuchi, Masatoshi Yoshino, 2013-04-17 The ffim Japan International Symposium Energy and Environment Global Warming was held in the Keidanren Guesthouse at the foot of Mt Fuji from October 21 to 24 1990

The symposium was conducted in the context of ffiM Japan s longstanding commitment to good corporate citizenship On this beautiful planet with its inter dependent waters lands and atmo sphere we consider that the problems relating to the global environment are the most serious that the human race will face in the near future The symposium provided an opportunity for forty scientists and researchers from a wide variety of international backgrounds to address matters relating to the global environment in an international forum Eighteen papers were presented followed by panel and group discussions on which the concluding remarks and recommendations are based We chose three types of papers to target different aspects of the condition of the global environment the natural science component the socio economic component and the energy component which links these two On the first day the symposium began with a plenary speech by Dr J Kondo followed by three keynote speeches each with a particular focus The following day six speakers offered papers relating to the previous day s keynote speeches

Municipal Entrepreneurship and Energy Policy Alison E. Woodward, Jerry Ellig, Tom R. Burns, 2019-06-26

Originally published in 1994 The energy crisis of the 1970s provided an opportune climate for public sector entrepreneurship to develop The authors present case studies from six innovative and diverse municipalities in Denmark France Germany Sweden and the United States The studies document problems these communities encountered while implementing new ideas in energy conservation and changes in energy supply and municipal planning Each community was selected on the basis of its early vigorous response to the energy crisis and then followed up to examine roadblocks along the way to innovation in the public sector The case studies highlight the challenges policy entrepreneurs face and the tactics they employ revealing crucial differences between public and private sector entrepreneurship

Nuclear Politics James M. Jasper, 2014-07-14 Why did nuclear energy policies in France Sweden and the United States very similar at the time of the oil crisis of 1973 and 1974 diverge so greatly in the following years In answering this question James Jasper challenges one of the most popular trends in political analysis explanations relying exclusively on political and economic structures to account for public policies Jasper proposes a new cultural and state centered approach one heeding not only structural factors but cultural meanings individual biographies and elite discretion Surveying the period from the successful commercialization of light water reactor technology in the early 1960s to the present he explains the events that occurred after 1973 France built even more reactors than it needed the United States canceled most reactor orders and Sweden completed planned nuclear plants but decided to phase out nuclear energy by 2010 This work is based on one hundred interviews with managers policymakers and activists in the three countries In addition to providing a unique theoretical perspective it broadens our understanding of nuclear policy by looking at three countries in depth and over a long historical span Originally published in 1990 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in

Change Ferenc L. Toth, 1989 Risk Analysis and Decision Processes H.C. Kunreuther, J. Linnerooth, J. Lathrop, H. Atz, S. Macgill, C. Mandl, Martin Schwarz, M. Thompson, 2012-12-06 For old and new studies in decision making and risk analysis this book should stand at the watershed. Studies of conflict resolution and public policy will surely now have to take account of the model investigation provided by the IIASA team and many things will not be the same again. This is a report of inquiries into the siting of liquefied energy gas LEG facilities in the Federal Republic of Germany, the Netherlands, the United Kingdom and the United States. The risks of transporting this highly combustible stuff and the economic benefits of being able to bring a natural energy source from one side of the globe to the other, holding it and piping it out as needed, make LEG a model case for studying the public response to dangerous technology. The dangers of LEG are different from those of nuclear power, for instance, where the response too often becomes entangled with the fear of nuclear war. The dangers of LEG include uncontrollable explosions rather than insidious contamination. But the degree of dangerousness is very much of the same order as that of nuclear power and is at least as difficult to assess. In four different countries, the constitutional procedures involved in obtaining approval of nuclear or LEG facilities are on record. The four case histories here are a model for comparative study of conflict resolution. The period over which the negotiations developed is much the same. Global Energy Justice Benjamin K. Sovacool, Michael H. Dworkin, 2014-10-02 This book explores how the idea of justice can give us a way to better assess and resolve energy challenges and problems.
