Sintering Processes Materials Science Research Volume 13:

Sintering Key Papers S. Somiya, Y. Moriyoshi, 2012-12-06 The 4th International Symposium on the Science and Technology of Sintering was held on 4-6 November 1987 in Tokyo. Among the many technical sessions was one entitled Session for Sintering Case Study. Over 200 participants heard these invited talks. Although some papers were over 20 years old, it is necessary to understand the authors' way of thinking. Since the end of the Second World War, many excellent papers related to sintering have appeared in many different academic journals. Some of these papers are still of value and are still being read by today's students. The questions we have to ask are: Why does the scholar think this way? Why did the scholar perform his experiments? What is the mechanism of sintering? What is the liquid phase of sintering? What is the behavior of sintering additives? What is the history and development of sintering theory? This book includes these sort of historical papers and also new original papers on sintering, all of which are very important to our understanding of the subject. Several papers have been added for this English edition, which is thus more comprehensive than its Japanese counterpart. These papers were spread out in many different sources, and the benefits of collecting them together in book form is obvious. **Sintering** Volodymyr Shatokha, 2012-03-23 This book is addressed to a large and multidisciplinary audience of researchers and students dealing with or interested in sintering. Though commonly known as a method for production of objects from fines or powders, sintering is a very complex physicochemical phenomenon. It is complex because it involves a number of phenomena exhibiting themselves in various heterogeneous material systems in a wide temperature range and in different physical states. It is a multidisciplinary research area because understanding of sintering requires a broad knowledge from solid state physics and fluid dynamics to thermodynamics and kinetics of chemical reactions. Finally, sintering is not only a phenomenon. As a material processing method, sintering embraces the wide group of technologies used to obtain such different products as, for example, iron ore agglomerate and luminescent powders. As a matter of fact, this publication is a rare opportunity to connect the researchers involved in different domains of sintering in a single book. **Physical Metallurgy** R.W. Cahn, P. Haasen, 1996-02-09 This is the fourth edition of a work which first appeared in 1965. The first edition had approximately one thousand pages in a single volume. This latest volume has almost three thousand pages in 3 volumes, which is a fair measure of the pace at which the discipline of physical metallurgy has grown in the intervening 30 years. Almost all the topics previously treated are still in evidence in this version, which is approximately 50% bigger than the previous edition. All the chapters have been either totally rewritten by new authors or thoroughly revised and expanded either by the third edition authors alone or jointly with new co-authors. Three chapters on new topics have been added, dealing with dry corrosion, oxidation and protection of metal surfaces, the dislocation theory of the mechanical behavior of intermetallic compounds, and most novel, a chapter on polymer science for metallurgists, which analyses the conceptual mismatch between metallurgists and polymer scientists' way of looking at materials. Special care has been taken throughout all chapters to incorporate the

latest experimental research results and theoretical insights Several thousand citations to the research and review literature are included in this edition There is a very detailed subject index as well as a comprehensive author index The original version of this book has long been regarded as the standard text in physical metallurgy and this thoroughly rewritten and updated version will retain this status

Engineering Ceramics M. Bengisu, 2013-06-29 Today's rapidly advancing technology always demands materials with more stringent specifications for each new application The industrial world asks for machines and electronic equipment with higher production rates improved reliability longer service life higher precision and resistance to more severe service conditions Engineering ceramics are partly a result of this need and the developments in today's technology and industry Scientists and manufacturers played a key role in the development of engineering ceramics in the past 50 years Today ceramics constitutes one of the most studied materials groups Due to the very large number of publications in this domain it takes a lot of skill to keep up with the development in ceramic materials just as in any other field Nevertheless it is the responsibility of the student technician engineer or scientist to be aware of major developments in their field Books describing the state of art in the developing science and engineering fields are indispensable sources Yet no book can be complete or final in that sense This book gives a brief introduction to the structure of ceramic materials and then follows a flow similar to that which a ceramic product experiences during its lifetime It starts with the raw material continues with the processing and consolidation of these materials and ends with the basic properties characterization and applications I hope that it will serve its purposes and be of some help to those who search for answers

Molecular Adhesion and Its Applications Kevin Kendall, 2001-03-31 This book sets out to describe the importance of adhesion in our Universe Although we believe that the universe is expanding and flying apart we can also see that the Earth and its parts are sticking together with great tenacity Gravitation explains part of this attraction on earth but is insufficient to explain why adhesives stick jumbo jets together or why our bodies do not fall apart To understand the strong attractions between earthly matter we must introduce the idea of molecular adhesion the fact that all molecules attract each other with a considerable force This idea at first seems paradoxical because we can identify situations where adhesion is very strong for example when paint sticks to a surface but we can also see cases where adhesion is very weak when sand flows through an hour glass The objective of the book is to provide explanations for these apparently perverse effects

Emergent Process Methods for

High-Technology Ceramics Robert F. Davis, Hayne Palmour, Richard L. Porter, 2012-12-06 This volume constitutes the Proceedings of the November 8-10 1982 Conference on EMERGENT PROCESS METHODS FOR HIGH TECHNOLOGY CERAMICS held at North Carolina State University in Raleigh. It was the nineteenth in a series of University Conferences on Ceramic Science initiated in 1964 by four institutions of which North Carolina State University is a charter member along with the University of California at Berkeley, Notre Dame University and the New York State College of Ceramics at Alfred University. More recently ceramic oriented faculty in departments at the Pennsylvania State University and Case Western Reserve University have joined the four initial institutions as permanent members of the consortium. These research oriented conferences each uniquely concerned with a timely ceramic theme have been well attended by audiences which typically were both international and interdisciplinary in character. Their published Proceedings have been well received and are frequently cited. This three day conference addressed the fundamental scientific background as well as the technological state of the art of several novel methods which are beginning to influence present and future directions for non traditional ceramic processing thus affecting many of the advanced ceramic materials needed for a wide variety of research and industrial applications. The number, the importance and the application of new ceramic processing techniques have expanded considerably during the last ten years.

Ceramic Microstructures '86 Joseph A. Pask, Anthony G. Evans, 2013-11-11 The Proceedings of the International Materials Symposium on Ceramic Microstructures 86 Role of Interfaces presents a comprehensive coverage of the past decade's advances in ceramic science and technology related to microstructures. The term microstructure is used in the broad sense and is synonymous with character. Character is defined as a complete detailed description of chemical and physical characteristics of a material. This symposium is the third in a series held every ten years on ceramic microstructures. The first symposium in 1966 had as a subtitle Their Analysis, Significance and Production and emphasized the need and importance of characterization in order to fully understand the chemical and physical properties of materials. The second Symposium in 1976 placed emphasis on the exploration of characters most suited and needed for Energy Related Applications. By the time of that conference the sequence of processing characterization properties was fully accepted. It was recognized that characterization was the basis of materials science, the objective of processing was to produce a desired character that was considered necessary to realize a given property or behavior. To further emphasize the importance of character the symposium dealt primarily with the property character coupling.

Hydrogen Effects in Catalysis Paal, 2020-09-10 This book covers hydrogen effects in catalysis in the broadest sense from surface science to industrial applications. It draws the attention of the catalysis community to the importance of the phenomena of hydrogen effects both in the science and technology of catalysis.

Catalyst Deactivation 1994 G.F. Froment, B. Delmon, 1994-09-08 Catalyst Deactivation 1994 was an expansion of earlier highly successful symposia. The objective of the symposium was to promote a scientific approach of the phenomenon of catalyst deactivation which will contribute to the development of catalysts which are less subject to structural transformations and more resistant to poisons and coke formation. These aspects are dealt with in 12 plenary lectures, 48 oral presentations and 35 poster papers which were critically selected from an impressive response from some 30 countries. Both fundamental and applied aspects were covered. The deactivation of catalysts in important industrial processes like fluid bed catalytic cracking, hydrotreatment, hydrodesulfurization, catalytic reforming, hydrodenitrogenation, steam reforming, hydrodemetallization, hydrocracking, Fischer Tropsch synthesis, propane dehydrogenation, phthalic anhydride synthesis received considerable attention. Mechanisms of poisoning, sintering and coking were further investigated and modelled and new experimental techniques for the characterization and the quantification of deactivation were also introduced.
