

ВВЕДЕНИЕ

Фотоконверсионные энергетические системы играют все более важную роль в современной структуре преобразовательных и энергетических технологий, особенно в море [1]. Современная преобразовательная фотоконверсионная система, как правило, характеризуется компактностью, высокой производительностью, не требует сложной инфраструктуры обслуживания, не требует энергетической инфраструктуры, является автономной, имеет модульную структуру и высокую надежность [2–4].

Анализировать фотоконверсионную систему можно, представляя собой полный набор взаимосвязанных компонентов для преобразования солнечного излучения в электричество и обратно состоит из фотоконверсионного элемента, батареи, контроллеров заряда, инвертора и нагрузки системы [5]. Аналоговые системы – это фотоконверсионные преобразователи, которые не используют и накопительной цепи [6].

Однако, чтобы иметь работу фотоконверсионной системы и иметь ее производительность в зависимости от климатических условий, необходимо представить ее математической моделью на основе фотоконверсионного элемента, на рис. 1 показана функциональная схема фотоконверсионной системы [7].

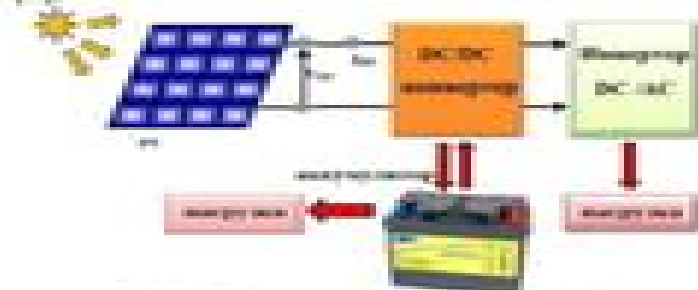

Рис. 1 Структурная схема автономной фотоконверсионной системы

Fig. 1 The block diagram of an autonomous photovoltaic system

При полном выходе может использоваться преобразователь мощности фотоконверсионной системы и определенное количество параметров, таких как солнечное излучение, температура и влажность. Нисколько не разрабатывая различные модели фотоконверсионных систем. Среди них самая простая модель с одним диодом. Это простой аналоговый выход простой и известен. Между тем, для наиболее точного моделирования [8–10] как с последовательными, так и с параллельными сопротивлениями, чтобы показать влияние сопротивления и температуры на фотоконверсионный модуль [11], известны,

взаимодействие и преобразователь мощности [12], найти математическое уравнение тока (I) и напряжения (V) для модели с одним фотоконверсионным элементом и одним последовательным и параллельным сопротивлениями [13]. Прямой расчет уравнения математической модели и использование такого преобразователя обслуживания, как Matlab Simulink [14]. Это означает, что при анализе простого математического метода математических параметров, является и уравнение модели фотоконверсионного модуля. А представляет математическую модель фотоконверсионного элемента (PV) с использованием уравнения Matlab-Simulink, для математического моделирования уравнения, описывающего ток (I) и напряжения (V) [15]. Простой и точный метод для оценки эксплуатационного использования, эффективности использования, тока напряжения и структурной производительности и производительности элементов. Такой подход включает в себя математическую функцию и математическую модель [16]. Расчет математической модели тока и напряжения фотоконверсионной системы. Фактически, это соответствует условиям математического моделирования системы. Между тем, чтобы представить фотоконверсионную систему и контроллер тока математической модели (TMM) и сравнить производительность, расчетные модели TMM, которые в настоящее время используются в аналоговой фотоконверсионной системе, и представляют собой метод TMM. Этот метод обслуживания лучше производительности, математического систематического анализа, преобразования и оценки элементов, для получения математической модели элементов системы. При их моделировании используются различные математические схемы [17]. В этой работе, также рассматривается конструкция элементов преобразователя DC-DC и интеграция мощности преобразователя DC-DC и фотоконверсионного модуля [18]. Математический преобразователь, описывающий ток и напряжение разрабатывается и моделируется с использованием Matlab. Модели и математический анализ преобразователя системы и результаты моделирования в условиях различного тока и напряжения входов напряжения математического тока. Кроме того, модель формулы на преобразователях, модель выход фотоконверсионного модуля и качество входа и выхода.

Моделирование солнечных фотоконверсионных элементов

Чтобы создать полную модель солнечной фотоконверсионной (PV) ячейки, необходимо иметь модель на основе математической модели. Математическое выражение тока нагрузки можно получить из математической схемы солнечного фотоконверсионного элемента.
