Estimating Postfire Changes in Production and Value of Northern Rocky Mountain-Intermountain Rangelands

David Lawrence Peterson, 1984 A simulation model was developed to estimate postfire changes in the production and value of grazing lands in the Northern Rocky Mountain Intermountain region Ecological information and management decisions were used to simulate expected changes in production and value after wildfire in six major rangeland types permanent forested range ponderosa pine transitory range Douglas fir larch lodgepole pine western white pine mountain grassland sagebrush pinyon juniper and western hardwoods Changes varied widely in quantity and duration among the range types The largest decrease in net value was calculated for mountain grassland 7 acre for a 2 year period The largest increase in net value was calculated for a ponderosa pine sawtimber stand with 100 percent basal area removal 36 acre for a 150 year period The estimates calculated in this study should be useful in land and fire management planning in the Northern Rocky Mountain Intermountain area
