Techniques with Trypanosomes William Hepburn Russell Lumsden, William John Herbert, Gillian J. C. McNeillage, 1973

The African Trypanosomes Samuel J. Black, J. Richard Seed, 2006-04-11 African trypanosomes are tsetse transmitted protozoa that inhabit the extracellular compartment of host blood. They cause fatal sleeping sickness in people and Nagana a wasting and generally fatal disease in cattle. While trypanosomes are most common to Africa about 30% of Africa's cattle graze on the fringe of the tsetse habitat, some species have spread beyond its borders to Asia, the Middle East, and South America. The African Trypanosomes volume one of World Class Parasites is written for researchers, students, and scholars who enjoy reading research that has a major impact on human health or agricultural productivity and against which we have no satisfactory defense. It is intended to supplement more formal texts that cover taxonomy, life cycles, morphology, vector distribution, symptoms, and treatment. It integrates vector, pathogen, and host biology and celebrates the diversity of approach that comprises modern parasitological research.

Control and Surveillance of Human African Trypanosomiasis, 2013 This report provides information about new diagnostic approaches, new therapeutic regimens, and better understanding of the distribution of the disease with high quality mapping. The roles of human and animal reservoirs and the tsetse fly vectors that transmit the parasites are emphasized. The new information has formed the basis for an integrated strategy with which it is hoped that elimination of HAT will be achieved. The report also contains recommendations on the approaches that will lead to elimination of the disease. Human African Trypanosomiasis (HAT) is a disease that afflicts populations in rural Africa where the tsetse fly vector that transmits the causative trypanosome parasites thrives. There are two forms of HAT: one known as gambiense HAT is endemic in West and Central Africa and causes over 95% of current cases; the other known as rhodesiense HAT is endemic in East and southern Africa and accounts for the remainder of cases. The presence of parasites in the brain leads to progressive neurological breakdown. Changes to sleep/wake patterns are among the symptoms that characterize the disease, also known as sleeping sickness. Eventually, patients fall into a coma and die if not treated. Different treatments are available against parasites present in the haemolymphatic system (first stage) and those that have entered the brain (second stage). Currently, lumbar puncture is required to select the appropriate drug.

Proceedings of First Symposium on New World Trypanosomes, **Trypanosomes and Trypanosomiasis** Stefan Magesz, Magdalena Radwanska, 2013-09-24 This new volume, written by experts in the field of trypanosome research, covers every aspect of trypanosome vector-host biology. It is a must-read for basic researchers working with trypanosomes and related organisms, infection, and drug development, as well as parasitology in a broader sense.
