The Computer In Optical Research Methods And Applications Topics In Applied Physics Vol 41:

Probability, Statistical Optics, and Data Testing B.R. Frieden, 2012-12-06 A basic skill in probability is practically demanded nowadays in many branches of optics especially in image science On the other hand there is no text presently available that develops probability and its companion fields stochastic processes and statistics from the optical perspective Short of a book a chapter was recently written for this purpose see B R Frieden ed The Computer in Optical Research Topics in Applied Physics Vol 41 Springer Berlin Heidelberg New York 1980 Chap 3 Most standard texts either use illustrative examples and problems from electrical engineering or from the life sciences The present book is meant to remedy this situation by teaching probability with the specific needs of the optical researcher in mind Virtually all the illustrative examples and applications of the theory are from image science and other fields of optics One might say that photons have replaced electrons in nearly all considerations here We hope in this manner to make the learning of probability a pleasant and absorbing experience for optical workers Some of the remaining applications are from information theory a concept which complements image science in particular As will be seen there are numerous tie ins between the two concepts Students will be adequately prepared for the material in this book if they have had a course in calculus and know the basics of matrix manipulation

Digital Pattern Recognition K. S. Fu, 2013-03-07 Since its publication in 1976 the original volume has been warmly received We have decided to put out this updated paperback edition so that the book can be more accessible to students This paperback edition is essentially the same as the original hardcover volume except for the addition of a new chapter Chapter 7 which reviews the recent advances in pattern recognition and image processing Because of the limitations of length we can only report the highlights and point the readers to the literature A few typographical errors in the original edition were corrected We are grateful to the National Science Foundation and the Office of Naval Research for supporting the editing of this book as well as the work described in Chapter 4 and a part of Chapter 7 West Lafayette Indiana March 1980 K S Fu Preface to the First Edition During the past fifteen years there has been a considerable growth of interest in problems of pattern recognition Contributions to the blossom of this area have come from many disciplines including statistics psychology linguistics computer science biology taxonomy switching theory communication theory control theory and operations research Many different approaches have been proposed and a number of books have been published Most books published so far deal with the decision theoretic or statistical approach or the syntactic or linguistic is still far from its maturity many approach

Modular Optical Design O.N. Stavroudis, 2013-04-17 Images are ubiquitous Their formation is one of nature's universalities Water droplets in suspension act in concert to produce rainbows A partially filled wine glass can be made to form the image of a chandelier at a boring dinner party The bottom of a water glass too can be made to produce an optical image wildly distorted perhaps but nevertheless recognizable as an optical image Primitive folklore abounds with images Perseus used his highly polished shield as a rear view mirror to lop off Medusa's head without turning himself into

stone Narcissus displaying incredibly poor taste fell in love with his own reflection in a pool of water causing poor Echo to pine away to a mere echo and providing yet another term for the psychoanalytic lexicon Strepsades according to Aristophanes proposed using a burning stone to melt a summons off the bailiff's wax tablet And the castaways in Jules Verne's MYsterious Island made a burning glass by freezing water in a watch crystal Everyone from the Baron Munchhausen to Tom Swift has gotten into the optics act with incredible but eminently useful optical devices Indeed Mother Nature herself has had a hand in evolving image making devices Any reasonably symmetric glob of transparent material such as an aggregate of cells is capable of forming an image It is not difficult to imagine the specialization of such an aggregate into a blastula like structure with an anterior window and light sensitive neurons at its posterior region **Optical Holography** P.
