Testing Safetyrelated Software:

Testing Safety-Related Software Stewart Gardiner,2012-12-06 As software is very complex we can only test a limited range of the possible states of the software in a reasonable time frame In 1972 Dijkstra 1 claimed that program testing can be used to show the pres ence of bugs but never their absence to persuade us that a testing approach alone is not acceptable This frequently quoted statement represented our knowledge about software testing at that time and after over 25 years intensive practice experiment and research although software testing has been developed into a validation and ver ification technique indispensable to software engineering discipline Dijkstra s state ment is still valid To gain confidence in the safety of software based systems we must therefore assess both the product and the process of its development Testing is one of the main ways of assessing the product but it must be seen together with process assessment in the context of an overall safety case This book provides guidance on how to make best use of the limited resources available for testing and to maximise the contribution that testing of the product makes to the safety case 1 1 Context The safety assurance of software based systems is a complex task as most fail ures stem from design errors committed by humans To provide safety assur on the integrity of the system and put ance evidence needs to be gathered forward as an argued case the safety case that the system is adequately safe
