*Leukocyte-derived matrix metalloproteinase-9 in patients with coronary artery disease* Simon Jönsson, 2015-02-18

Inflammation is closely associated with development of atherosclerosis. The proteolytic enzyme matrix metalloproteinase MMP 9 is considered to play a prominent role in this process. MMP 9 has also been introduced as a marker for plaque vulnerability. Still, the possible mechanisms behind altered levels of MMP 9 and its tissue inhibitors TIMPs in patients with atherosclerotic disease remain unclear. The general aim of this thesis was to compare leukocyte derived MMP 9 and TIMPs in patients with coronary artery disease CAD and healthy controls and to further relate the findings to psychological stress and glucocorticoid sensitivity. Levels of leukocyte derived MMP 9 and TIMP 1 showed a significant difference between CAD patients and controls. Neutrophils in CAD patients were more prone to release MMP 9 and furthermore PBMCs in patients expressed higher levels of MMP 9 and TIMP 1 and 2 mRNA than PBMCs in controls while there were no differences in plasma or serum levels. The increase in leukocyte derived levels of MMP 9 and TIMPs indicate the presence of preactivated leukocytes in CAD. Inflammation has been proposed as a mechanistic link between cardiovascular risk and depressive symptoms. We investigated whether the overexpression of leukocyte derived MMP 9 and TIMPs in CAD patients was associated with psychological factors. Patients exhibited sustained elevations in depressive symptoms; however, these symptoms were not related to any MMP 9 or TIMP variables. The findings suggest that overexpression of leukocyte derived MMP 9 and TIMPs and elevated depressive scores represent two parallel phenomena in CAD. Chronic inflammation may be associated with reduced glucocorticoid sensitivity. We found that PBMCs in CAD patients expressed significantly increased levels of glucocorticoid receptor GR mRNA, whereas GR mRNA levels did not differ between patients and controls. Moreover, in ex vivo assays dexamethasone efficiently suppressed MMP 9 and TIMPs equally or even more in patients compared to controls. The findings provide evidence for enhanced glucocorticoid sensitivity in CAD patients and also suggest that a state of relative hypocortisolism may contribute to the overexpression of leukocyte derived MMP 9 and TIMPs. Lastly, we explored the release of MMP 9, TIMPs, and cortisol in response to acute mental stress in CAD patients. Patients who exhibited a significant stress-induced increase in serum MMP 9 also exhibited an altered cortisol response. Moreover, the susceptibility to stress-induced increase in serum MMP 9 was associated with shorter leukocyte telomere length and atherosclerotic plaque burden. The findings highlight the existence of a high risk group which may be in need of improved diagnostic and therapeutic strategies.

**Cardiovascular Specific Gene Expression** P.A.F.M. Doevendans, Robert S. Reneman, Marc van Bilsen, 2013-04-17 Improving our insights into the genetic predisposition to cardiovascular disease is one of the most important challenges in our field in the next millennium not only to unravel the cause of disease but also to improve the selection of patients for particular treatments Nowadays for example subjects with a cholesterol above a particular plasma level are exposed to a cholesterol lowering regime based upon the beneficial outcome of epidemiological studies which include subjects not prone to the disease despite a plasma cholesterol above the accepted level Identification of the patients who are genetically predisposed to the consequences of this disorder will reduce the number of subjects unnecessarily treated and hence the costs of health care Because in most cardiovascular diseases the genetic component is a consequence of more than one gene defect only limited progress has as yet been made in identifying subjects genetically at risk For example in hypertension only in less than 10% of the patients the genetic defect has been identified It has been known for quite some time that in heart and blood vessels fetal genes are as high blood pressure and upregulated or induced when they are exposed to such disorders ischemia Little is known about the function of these genes
